## Data in Many Forms...

Statistics Canada disseminates data in a variety of forms. In addition to publications, both standard and special tabulations are offered on computer print-outs, microfiche and microfilm, and magnetic tapes. Maps and other geographic reference materials are available for some types of data. Direct access to aggregated information is possible through CANSIM, Statistics Canada's machine-readable data base and retrieval system.

## How to Obtain More Information

Inquiries about this publication and related statistics or services should be directed to:

Population Projections Section,  
Demography Division,

Statistics Canada, Ottawa, K1A 0T7 (Telephone: 990-9585) or to the Statistics Canada reference centre in:

St. John's (772-4073)	Sturgeon Falls (753-4888)
Halifax (426-5331)	Winnipeg (949-4020)
Montréal (283-5725)	Regina (359-5405)
Ottawa (990-8116)	Edmonton (420-3027)
Toronto (966-6586)	Vancouver (666-3691)

Toll-free access is provided in all provinces and territories, for users who reside outside the local dialing area of any of the regional reference centres.

Newfoundland and Labrador	Zenith 0-7037
Nova Scotia, New Brunswick and Prince Edward Island	1-800-565-7192
Quebec	1-800-361-2831

## Des données sous plusieurs formes...

Statistique Canada diffuse les données sous formes diverses. Outre les publications, des totalisations habituelles et spéciales sont offertes sur imprimés d'ordinateur, sur microfiches et microfilms et sur bandes magnétiques. Des cartes et d'autres documents de référence géographiques sont disponibles pour certaines sortes de données. L'accès direct à des données agrégées est possible par le truchement de CANSIM, la base de données ordiolingue et le système d'extraction de Statistique Canada.

## Comment obtenir d'autres renseignements

Toutes demandes de renseignements au sujet de cette publication ou de statistiques et services connexes doivent être adressées à:

Section des projections démographiques,  
Division de la démographie,

Statistique Canada, Ottawa, K1A 0T7 (téléphone: 990-9585) ou au centre de consultation de Statistique Canada à:

St. John's (772-4073)	Sturgeon Falls (753-4888)
Halifax (426-5331)	Winnipeg (949-4020)
Montréal (283-5725)	Regina (359-5405)
Ottawa (990-8116)	Edmonton (420-3027)
Toronto (966-6586)	Vancouver (666-3691)

Un service d'appel interurbain sans frais est offert, dans toutes les provinces et dans les territoires, aux utilisateurs qui habitent à l'extérieur des zones de communication locale des centres régionaux de consultation.

Page 55, Table 18

For years starting in 1983, data on dependancy ratios should be ignored

Correct figures should read:

	<u>0-17</u>	<u>65+</u>	<u>Total</u>
1983:	42.4	15.9	58.3
1991:	38.0	18.7	56.7
2001:	31.6	21.4	53.0
2011:	25.9	24.2	50.1
2021:	25.7	33.4	59.1
2031:	24.5	45.3	70.8

Part II, Detailed Table D.2, page 103

Life expectancy figures should be ignored

Correct figures should read:

Male:

72.3; 72.4; 73.2; 71.4; 71.5; 71.5;  
72.7; 72.6; 72.8; 72.4; 73.0; 65.6;  
65.6

Female:

79.4; 79.1; 80.9; 78.8; 79.6; 79.1;  
79.4; 79.2; 80.0; 79.5; 80.0; 75.0;  
75.0

Part II, Detailed Tables D.3

Dependancy ratio figures should be ignored

Correct dependancy ratios can be calculated by dividing the population age 0-17 and/or age 65+ by the population age 18-64

Page 55, tableau 18

Pour les années 1983 et suivantes, les données sur les rapports de dépendance sont erronées

Les données devraient se lire:

	<u>0-17</u>	<u>65+</u>	<u>Total</u>
1983:	42.4	15.9	58.3
1991:	38.0	18.7	56.7
2001:	31.6	21.4	53.0
2011:	25.9	24.2	50.1
2021:	25.7	33.4	59.1
2031:	24.5	45.3	70.8

Partie II, Tableau détaillé D.2, page 103

Les données de l'espérance de vie sont erronées

Les données devraient se lire:

Sexe masculin:

72.3; 72.4; 73.2; 71.4; 71.5; 71.5;  
72.7; 72.6; 72.8; 72.4; 73.0; 65.6;  
65.6

Sexe féminin:

79.4; 79.1; 80.9; 78.8; 79.6; 79.1;  
79.4; 79.2; 80.0; 79.5; 80.0; 75.0;  
75.0

Partie II, Tableaux détaillés D.3

Les données sur les rapports de dépendance sont erronées

Les données peuvent être obtenues en divisant la population âgée de 0-17 ans et/ou de plus de 65 ans, par les effectifs de 18-64 ans

## PREFACE

This report, the third of its kind, contains a range of population projections. They are based on 1983 population estimates and the most recent demographic trends, covering a period up to 2006 for the provinces and territories and up to 2031 for Canada. These projections have been developed as part of Statistics Canada's continuing programme of population, household and family projections, and supersede those published in 1979.

The demographic scene of Canada is changing rapidly. Significant developments have taken place since the publication of the last projections. The fertility rate, which was already at the sub-replacement level, has declined further to an all-time low; mortality has decreased, especially at the upper end of the age spectrum; and internal migration has altered radically, having reversed from its westward trend. The projections presented here take into consideration the impact these events likely will have on future population trends and distributions.

Projections, of course, are not predictions. They are based on stated assumptions which incorporate varying degrees of uncertainty about future levels and patterns in the components of population change. Because of these uncertainties, alternative projections are presented, encompassing a plausible range of variations in the factors affecting the future size and structure of the population.

Planners, policy makers and the public at large interested in the future course of demographic developments in Canada and the related major issues which will confront our generation and those to come, should find this report informative.

Martin B. Wilk,  
Chief Statistician of Canada.

## PRÉFACE

Les projections présentées dans ce rapport, les troisièmes à être publiées par Statistique Canada, ont été établies en tenant compte des tendances démographiques les plus récentes. Elles ont comme population de départ, les effectifs estimés au 1<sup>er</sup> juin 1983; la période de projection va jusqu'en 2006 dans le cas des provinces et territoires et jusqu'en 2031 pour le Canada. Ces projections s'insèrent dans le cadre du programme permanent de Statistique Canada - projections de population, des ménages et des familles - et viennent remplacer celles publiées en 1979.

La situation démographique canadienne évolue rapidement. Des changements notables s'y sont inscrits depuis la publication des dernières projections. La fécondité, déjà au-dessous du seuil de remplacement, a poursuivi sa baisse; la mortalité a diminué, notamment à l'extrémité supérieure de l'échelle des âges et la migration interne, favorable aux provinces de l'ouest ces dernières années, a connu un brusque revirement. Les perspectives actuelles prennent en compte l'incidence possible de ces facteurs sur l'évolution démographique future.

Une projection n'est évidemment pas une prédiction; elle traduit plutôt les tendances futures en fonction des hypothèses énoncées, hypothèses comportant à des degrés divers une certaine marge d'incertitude quant à l'évolution des facteurs de croissance. Afin de tenir compte des impondérables toujours présents dans tout exercice de projection, une gamme de scénarios est offerte, susceptibles de couvrir l'éventail des variations plausibles dans les composantes de la croissance.

Les responsables de l'élaboration des politiques et quiconque s'intéresse à l'avenir de la société canadienne et aux questions fondamentales qu'auront à débattre les générations présentes et futures, trouveront dans ce document maintes informations pertinentes.

Le statisticien en chef du Canada,  
Martin B. Wilk.

## ACKNOWLEDGEMENTS

This report and the projections represent the joint efforts of the staff of the Population Projections Section and several other members of the Demography Division. Overall direction for the development of the projections and the preparation of the report was provided by A. Romaniuc, K.G. Basavarajappa and M.V. George. Research on the component projections - fertility, mortality, internal and international migration - was carried out by a team consisting of M.V. George, M.J. Norris, J. Perreault, B. Ram, A. Romaniuc and G. Rowe. J. Ledent and M. Termote of the Institut national de la recherche scientifique, Université du Québec, Montréal, Quebec, acted as consultants for the development of a multi-regional migration model which was applied for projecting internal migration. A number of people from Statistics Canada have also helped in a variety of ways. E.T. Pryor and D.B. Petrie commented on an earlier draft. R. Lachapelle and D. Norris served as reviewers of this report and made helpful comments. Computer programming was done by B. Stéprien of Datacap Limited and V. Kawka. Research support, publication review and editing were provided by L. Paquette, N. Morin, M.B. Ismaily, L. Dell'Oso and many others of the Division. Typing assistance was mainly provided by D. St-Germain.

In the preparation of these projections, there have been consultations with a number of federal departments, provincial government departments and several experts in the field. These consultations and the deliberations on population projections at the meeting of the Federal-Provincial Committee on Demography in Ottawa, February 1984, were extremely beneficial in the development of the projection assumptions and the choice of the projection series.

## REMERCIEMENTS

Ce rapport ainsi que les projections qu'il contient sont le fruit des efforts conjugués du personnel de la Section des projections démographiques et de plusieurs autres membres de la Division de la démographie. La direction générale de l'élaboration des projections et de la préparation du rapport a été assumée par A. Romaniuc, K.G. Basavarajappa et M.V. George. La recherche relative aux composantes - fécondité, mortalité, migration interne et internationale - a été exécutée par une équipe composée de M.V. George, M.J. Norris, J. Perreault, B. Ram, A. Romaniuc et G. Rowe. J. Ledent et M. Termote de l'Institut national de la recherche scientifique, Université du Québec, Montréal (Québec), ont agi à titre de conseillers dans le développement d'un modèle de migration multi-régional, lequel a été utilisé pour la projection de la migration interne. Nombre de personnes de Statistique Canada ont aussi apporté leur contribution. E.T. Pryor et D.B. Petrie ont revu le manuscrit original. R. Lachapelle et D. Norris ont revu ce rapport et offert maintes suggestions pertinentes. Le traitement informatique et la programmation ont été effectués par B. Stéprien de Datacap Limited et V. Kawka. L'aide quant à la recherche, la rédaction et la révision a été fournie par L. Paquette, N. Morin, M.B. Ismaily, L. Dell'Oso et plusieurs autres membres de la Division. Le travail de secrétariat a été principalement exécuté par D. St-Germain.

Lors de l'élaboration de ces projections, certains ministères fédéraux et provinciaux, ainsi que plusieurs spécialistes ont été consultés. Ces avis de même que les délibérations de la dernière Conférence fédérale-provinciale sur la démographie tenue à Ottawa en février 1984 se sont révélés d'une grande utilité dans le développement des hypothèses et le choix des scénarios de projection.

## INTRODUCTION

The previous set of Statistics Canada population projections for Canada, provinces and territories, based on the 1976 Census results and other relevant demographic data, was published in February 1979 (Statistics Canada, Catalogue No. 91-520). Following the practice of revising the population projections at periodic intervals, a new set of projections has been prepared in the light of the recent demographic trends and using 1983 population estimates as the base. Consequently, these projections, are as up-to-date as possible.

This report presents revised population projections for the provinces and territories from 1984 to 2006 and up to 2031 for Canada. The underlying assumptions were developed primarily up to 1996 as it is difficult to determine plausible assumptions for longer periods. For the period beyond 1996, it assumes that the parameters of each component remain constant at the levels projected for 1996; the projections beyond this period should therefore be used with caution. The projections for longer periods are prepared to comply with the demand for long-term planning.

The limitations of projections must be fully recognized. Projections, of course, are not predictions; they reflect the future growth trends, the emerging age-sex structure and the population distribution across the country which would occur under the stated assumptions. Their accuracy is thus conditional on how far the underlying assumptions correspond to what actually materializes as time passes. Demographic changes are influenced by the interrelations of many social and economic factors and the policies adopted by governments at all levels, including foreign governments. In many cases, these relationships are complex and largely unknown. While efforts are made to take these factors into account in the component assumptions, the projections are based on the perceptions of the future demographic changes and evolutions that appeared most likely at the time of preparation. Because of the uncertainties about the future levels and patterns in the components of population change, alternative projections are offered which encompass a plausible range of variations in the factors affecting future size and structure of the population.

C'est en février 1979 que Statistique Canada publiait ses dernières projections démographiques pour le Canada, les provinces et les territoires, à la lumière des résultats du recensement de 1976 et d'autres données démographiques pertinentes (Statistique Canada, n° 91-520 au catalogue). Conformément à sa politique en cette matière, le Bureau a révisé ses projections en tenant compte de l'évolution démographique récente. La population de départ pour la projection est la population estimée au 1<sup>er</sup> juin 1983.

Le présent rapport contient les nouvelles projections de la population du Canada de 1984 à 2031, des provinces et des territoires pour la période 1984-2006. Comme il est difficile de définir des hypothèses plausibles sur une période très longue, les hypothèses sous-jacentes visent la période allant jusqu'en 1996. Afin toutefois de répondre aux exigences de la planification à long terme, la période de projection est prolongée jusqu'en 2006 pour les provinces et jusqu'en 2031 pour le Canada. Au-delà de 1996, les paramètres sont maintenus constants au niveau projeté pour cette année-là; les projections au-delà de 1996 devront être employées avec prudence.

Il est important de souligner ce que l'on entend par projection. Une projection n'est évidemment pas une prédiction; elle traduit plutôt les tendances futures de la croissance démographique, l'évolution possible de la structure par âge et sexe et la distribution géographique en fonction des hypothèses retenues. L'exactitude d'une projection dépend de la mesure dans laquelle les hypothèses sous-jacentes seront confirmées par les faits. L'évolution démographique résulte de la conjugaison de nombreux facteurs d'ordre socio-économique et des politiques adoptées par les divers paliers de gouvernement et les pays étrangers. Cette relation est le plus souvent complexe et dans une large mesure, inconnue. Tous les efforts sont faits pour prendre en compte ces facteurs dans la mesure du possible, lors de l'élaboration des hypothèses. Il ne faut pas oublier toutefois que la projection est établie à partir de ce qui est perçu au moment de l'étude, comme étant l'évolution la plus vraisemblable ou plausible. Afin de tenir compte des impondérables toujours présents dans tout exercice de projection, nous présentons plusieurs scénarios de croissance susceptibles de couvrir l'éventail des variations plausibles dans les composantes de la croissance.

The uncertainty inherent in the projections varies according to the duration of the projections, the population size of the geographic area concerned and the segment of the population considered. As the future population of an area is strongly influenced by the initial base population and the process of change is cumulative, the reliability of the projections decreases over time. Also, because of the effect of internal migration, projections for areas with small population sizes tend to be less reliable than those for areas with large populations. Among the various age segments of population, projections of the number of adults are generally more reliable than those of children as fertility change does not affect the size of the adult population for a period of 15 to 17 years from the base year. Of the adult population, projections of the elderly will have the least error as they are less prone to migration.

Five projection series (Projections 1 to 5) selected from a combination of 18 projections are presented by age and sex for each year in this report.(1) The underlying assumptions are based on an analysis of trends in the components of population change, viz., fertility, mortality, international migration and internal migration.(2)

This report is divided into two parts. The first part provides highlights of the projection results, a brief description of the methodology, component assumptions, and an analysis of the projection results.

The second part presents the 1983 population estimates by age and sex, detailed tables for each of the five projection series selected, and summary tables for the remaining 13 projection series. More specifically, the tables give components of population change, 1984 to 2006; projections by sex and age (single years of age to age 24 and five-year age groups thereafter), for Canada, provinces and territories, 1984 to 2006; extensions of the selected five projections for Canada by five-year age groups for every fifth year, 2006 to 2031; and total population every fifth year according to the 13 projections not selected, and three additional analytical series with zero migration assumption, for Canada, provinces and territories, 1986 to 2006. The additional projections are included to provide a wider choice to the users and to aid demographic analysis and policy studies.

(1) For details of the selection process, see the section "Choice of Projection Series".

(2) For details of the component assumptions, see the relevant sections of this report. Also, see the separate background technical papers relating to each component. Demography Division, Statistics Canada, Ottawa (forthcoming).

L'incertitude inhérente aux projections varie selon la durée de la période couverte et la taille de la population visée. Comme la population future d'une région est une fonction directe de la population de départ, la fiabilité des projections décroît avec le temps. Par ailleurs, en raison de l'incidence de la migration interne, une projection pour des régions peu peuplées sera moins fiable qu'une projection établie pour les régions à forte population. Parmi les divers groupes d'âge, l'effectif des adultes peut être prévu avec plus d'assurance que celui des jeunes puisque les variations de la fécondité n'affectent pas la taille de la population adulte avant 15 à 17 ans à compter de l'année de départ. Au sein de la population adulte, le groupe des personnes âgées est généralement prévu avec plus d'assurance car la migration est moins accusée dans ce groupe.

Nous présentons dans ce rapport cinq projections (projections 1 à 5), choisies parmi un ensemble de 18 possibles, selon l'âge, le sexe et pour chaque année(1). Les hypothèses sous-jacentes sont fondées sur une analyse des tendances de la mortalité, de la fécondité et de la migration, internationale et interne, les trois composantes de l'évolution démographique(2).

Ce rapport se divise en deux parties. Dans la première, sont présentés les points saillants des projections, une brève description des hypothèses, de la méthode utilisée et des résultats.

La seconde partie présente la population de départ selon l'âge et le sexe, estimée au 1<sup>er</sup> juin 1983, des tableaux détaillés de chacune des cinq projections retenues et des tableaux résumés des 13 projections non retenues. De façon spécifique, cette partie se compose des tableaux suivants: composantes de la croissance démographique, 1984 à 2006; population selon l'âge et le sexe (par année d'âge jusqu'à 24 ans et par groupe d'âge de cinq ans ensuite), pour le Canada, les provinces et les territoires, pour chaque année de 1984 à 2006; effectifs de la population canadienne par sexe et groupe d'âge quinquennal selon les cinq projections retenues, par bond de cinq ans, 2006 à 2031 et population totale pour les 13 autres combinaisons d'hypothèses pour le Canada, les provinces et les territoires par bond de cinq ans ainsi que les trois scénarios avec migration nulle, 1986 à 2006. Ces dernières sont ajoutées afin d'offrir un éventail plus complet et faciliter les études analytiques.

(1) Pour plus de détails sur les critères de sélection, voir la section "Choix des scénarios de projection".

(2) Pour plus de détails sur les hypothèses, voir les sections pertinentes de ce rapport. Voir également les rapports techniques relatifs à chaque composante, Division de la démographie, Statistique Canada, Ottawa (à venir).

## HIGHLIGHTS

A total of 18 projections were developed from a combination of three fertility (low: 1.4, constant: 1.7 and high: 2.2 children per woman), one mortality, two international migration (low: 50,000 and high: 100,000 net per year) and three internal migration assumptions. From these, five projection series were selected in order to offer a plausible range of future growth. These are labelled projections 1 to 5 and are shown with their assumptions in Table 9 of this report. Following are a few highlights of the projection results focussing on low- and high-growth scenarios.

- If the declining fertility and mortality and current low net international migration were to continue, Canada's population would grow at a slower pace during the coming years. From a current annual growth rate of around 1%, it would fall to a near zero-growth by 2006. This would represent a substantial shift from the 1950s when the population was increasing at a high rate of 2% to 3% per annum.
- Under the low fertility assumption of 1.4 children per woman and low net immigration of 50,000 per year, Canada's population size could reach a peak of some 28 million by the first decade of the next century. A decline in population would take place thereafter if fertility and immigration trends did not change.
- On the other hand, if the trends were to shift so that fertility increased to 2.2 children per woman, slightly higher than the replacement level, and net immigration doubled to 100,000 per year, the population would increase to 30 million by the turn of the century and to 38 million by 2031.
- At the beginning of the next century, if current low fertility and net immigration trends continue, there would be more deaths than births and natural increase (births minus deaths) would thus become negative. However, because of the net immigration of 50,000 per year, population would continue to grow for roughly another decade, with the decline beginning around 2012.
- Under the low fertility assumption of 1.4 children per woman and net immigration of 50,000 per year, the annual number of births falls from 371,000 in 1983 to 258,000 by 2006. If fertility remains constant at its current level of 1.7 children, the number of births falls to some 325,000 by the year 2006. However, it

## POINTS SAILLANTS

La combinaison des trois hypothèses de fécondité (faible: 1.4, constante: 1.7 et forte: 2.2 enfants par femme), de l'hypothèse de mortalité, des deux hypothèses de migration internationale (faible: 50,000 et forte: 100,000 net par an) et des trois scénarios de migration interne, a permis d'obtenir un ensemble de 18 projections. Parmi celles-ci, un sous-ensemble de cinq projections a été retenu, de façon à couvrir un éventail plausible des scénarios de croissance de la population canadienne. Ces projections, numérotées de 1 à 5, sont décrites au tableau 9 de ce rapport. Voici quelques points importants qui ressortent des projections, d'après les scénarios de croissance faible et forte.

- Le rythme de croissance de la population canadienne ralentira dans les années à venir si les tendances actuelles - baisse de la fécondité et de la mortalité et maintien d'un solde migratoire faible - devaient se poursuivre; on pourrait observer en 2006 un taux d'accroissement presque nul alors qu'il oscille présentement autour de 1% par année. C'est une situation très différente de celle des années cinquante où des taux de l'ordre de 2% à 3% étaient chose courante.
- Au cours de la première décennie du 21 siècle, dans l'hypothèse de baisse de la fécondité jusqu'à 1.4 enfant par femme et du maintien d'un solde migratoire de 50,000 par année, la population du Canada aurait presque atteint sa valeur maximale, quelque 28 millions d'habitants. Un déclin pourrait s'amorcer quelques années plus tard si les tendances de la fécondité et de l'immigration devaient se poursuivre.
- Par contre, en cas de rupture des tendances, si la fécondité devait augmenter légèrement au-dessus du niveau de remplacement des générations, soit 2.2 enfants par femme et si la migration nette devait doubler pour se chiffrer à 100,000 personnes par année, la population atteindrait 30 millions au tournant du siècle et 38 millions en 2031.
- Si la fécondité devait poursuivre encore quelques années son mouvement à la baisse et le solde migratoire se maintenir à son faible niveau actuel, l'accroissement naturel, c.-à-d. la différence entre les naissances et les décès, deviendrait nul au début du siècle prochain. La migration reporte toutefois le déclin de la population d'une décennie environ. Celui-ci s'amorce vers 2012 dans l'hypothèse d'un apport migratoire net de 50,000 par année.
- Dans l'hypothèse d'un prolongement des tendances actuelles, maintien d'un solde migratoire de 50,000 par année et baisse de la fécondité jusqu'à 1.4 enfant par femme, le nombre annuel des naissances diminuera, passant de 371,000 en 1983 à 258,000 en 2006. Si la fécondité devait se stabiliser à son niveau courant, la baisse serait moins prononcée, quelque 325,000

increases significantly to 434,000 by 2006 if the fertility rate rises to 2.2 children.

- Despite a marked improvement in life expectancy, a larger population size and an older age structure would push the annual number of deaths up from 180,000 in 1983 to more than 260,000 by 2006 (under all projections).
- Currently, the median age is 30 years which means that 50% of the population is below that age. The median age reaches 41 years by 2006 and 48 years by 2031 if low fertility, mortality and net immigration trends continue. Under the high fertility of 2.2 children per woman and high net immigration of 100,000 per year, the median age reaches 37 years by 2006 and remains at that level thereafter.
- The elderly population 65 years and over will grow at an extremely rapid pace over the next decades. At the beginning of the next century, more than 4 million Canadians will be over 65. By 2031, they would number around 7 million, almost three times their present size (under all the five projections).
- Under the low assumptions of fertility and net immigration, the elderly population would be approximately 15% of the population by 2006 and 27% by 2031, compared with only 10% at the present time. If trends were to reverse and fertility increased to 2.2 children, their proportion would still reach some 13% by the year 2006, and almost 19% by 2031.
- The pre-school and school-age population (age 0-17) would shrink substantially under the low fertility and net immigration assumptions, from 6.7 million in 1983 to 6.4 million by 1991 and 5 million by 2006. If however, fertility and net immigration increase to 2.2 children and 100,000 per year respectively, the number of children and youth would reach some 6.8 million in 1991 and 8.0 million in 2006.
- The population aged 18-24, the ages at which many people start families and join the work force, is expected to dwindle over the next 20 years. There were 3.3 million young adults in 1983; by 2006, their number may be between 2.6 and 2.8 million.

naissances annuelles vers 2006. Une reprise de la fécondité, jusqu'à 2.2 enfants par femme, entraînerait une augmentation importante du nombre des naissances, lequel pourrait atteindre 434,000 en 2006.

- Malgré une amélioration sensible de l'espérance de vie, une population accrue et une structure par âge plus vieille entraîneront une augmentation du nombre annuel des décès, lequel passe de 180,000 en 1983 à plus de 260,000 en 2006 (quel que soit le scénario retenu).
- Présentement l'âge médian de la population canadienne est de 30 ans, c'est-à-dire que 50% de la population a moins de 30 ans. En 2006, il atteindrait 41 ans et, si les tendances actuelles devaient se poursuivre, l'âge médian atteindrait 48 ans en 2031. Dans l'hypothèse d'une forte fécondité (2.2 enfants par femme) et d'une migration nette élevée (100,000 par an) l'âge médian se stabiliserait autour de 37 ans à partir de 2006.
- La croissance de la population âgée de 65 ans et plus se fera à un rythme très rapide au cours des prochaines décennies. Leur nombre s'élèvera à plus de 4 millions à l'aube du siècle prochain, et dépassera les 7 millions en 2031, soit trois fois le niveau actuel (quel que soit le scénario retenu).
- Dans l'hypothèse de faible fécondité et d'un solde migratoire peu élevé (50,000 par an), le groupe des 65 ans et plus pourrait représenter environ 15% de la population en 2006 et possiblement 27% en 2031, contre 10% présentement. Dans l'hypothèse d'une remontée de la fécondité (à 2.2 enfants par femme), leur part relative progresserait moins rapidement: elle passerait à 13% en 2006 et à près de 19% vers 2031.
- La population d'âge scolaire et préscolaire (les 0-17 ans) pourrait diminuer considérablement dans l'hypothèse de faible fécondité et faible migration: de 6.7 millions en 1983 à 6.4 millions en 1991 pour atteindre 5 millions en 2006. Si toutefois la fécondité devait remonter pour dépasser légèrement le seuil de remplacement et la migration nette doubler, à 100,000 par an, le nombre des jeunes de 0-17 ans atteindrait 6.8 millions en 1991 et 8.0 millions en 2006.
- L'effectif des jeunes adultes de 18-24 ans, âges stratégiques pour la formation des ménages et l'entrée dans la population active, diminuera au cours des deux prochaines décennies; il est de l'ordre de 3.3 millions présentement; on pourrait en compter entre 2.6 et 2.8 millions en 2006.

- The predominant labour force group, composed of persons in the age group 18-64, is expected to increase from the current 16 million to 19 million by 2006 under all the projections.
- The ratio of dependents (under 18 and over 65) to persons of working ages is likely to decrease in the years ahead because of the lowered fertility. By 2006, the dependency ratio may be of the order of 52 dependents per 100 persons of working age, substantially less than its current level of 59. From then on, however, the ratio could increase and, with the arrival of baby-boomers into retirement age, could reach 77 by 2031 under both the low- and the high-growth scenarios.
- Each province's share of the population alters very slowly during the projection period. Under the range of stated assumptions, Ontario would increase its share of population from 35% in 1983 to between 35% and 37% by 2006. Quebec would probably see its share slightly reduced from its current 26% to between 24% and 25%; and the two western-most provinces, Alberta and British Columbia, together would have between 21% and 25% of the population, compared to their present share of 21%.
- La population d'âge actif soit grosso modo les 18-64 ans, augmentera de plus de 3 millions au cours des deux prochaines décennies. En 2006, elle serait de l'ordre de 19 millions, quel que soit le scénario.
- Le rapport de dépendance (pour les moins de 18 ans et les plus de 65 ans) diminuera dans les années à venir à cause du poids réduit des jeunes, conséquence directe de la faible fécondité actuelle. En 2006, il serait de l'ordre de 52 dépendants pour 100 personnes de 18-64 ans, une baisse substantielle si on le compare au niveau actuel 59. Toutefois il pourrait augmenter par la suite et, avec l'arrivée des générations du baby-boom à l'âge de la retraite, atteindre 77 en 2031, selon les deux scénarios de croissance, forte et faible.
- Le poids démographique des provinces se modifie très lentement dans le temps. L'avenir, tel que le laissent entrevoir les projections, consacre la prépondérance de l'Ontario, qui pourrait regrouper entre 35% et 37% de la population en 2006, contre 35% présentement, réduit légèrement la part du Québec, de 26% en 1983 à quelque 24% ou 25% en 2006. L'Alberta et la Colombie-Britannique pourraient compter entre 21% et 25% de la population contre 21% présentement.

Part I

METHODOLOGY, COMPONENT ASSUMPTIONS  
AND PROJECTION RESULTS

Partie I

MÉTHODOLOGIE, HYPOTHÈSES  
ET RÉSULTATS

## GENERAL METHODOLOGY

The present projections were initially developed for each of the 24 Census Metropolitan Areas (CMAs) and the non-CMA part of each province of the country, making a total of 37 regions.(3) Except for Prince Edward Island and the two territories which have no CMA, provincial population projections were obtained by aggregating the projected figures for the corresponding CMAs and the non-CMA part of each province. For Prince Edward Island and the two territories, which do not have CMAs, projections were developed directly. Because the preliminary projections obtained for CMAs need further scrutiny and evaluation, they are not dealt with here.

The general projection methodology used is the regional cohort-component approach, which is essentially the same as that employed for the previous projections. There are two basic steps in this approach. First, a separate analysis and projection of each component of population growth - fertility, mortality and migration (internal and international) - is made using appropriate demographic parameters. These parameters, generally in the form of rates and ratios, are then applied to the population of the base year to obtain the future population by age and sex for each region. The base population of these projections is the 1983 postcensal population estimates.(4) Second, the provincial/territorial and national projections are derived by aggregating the projections for the corresponding regions and the provinces and territories, respectively. This procedure involves a "bottom-up" approach for obtaining projections at the national level.

The projections of each component of growth are made using Statistics Canada's projection model. The model is applied on a

(3) There were 24 CMAs at the time of the 1981 Census and 12 non-CMA parts for the 10 provinces and the two territories, making 36 regions. The 37th region was created by subdividing the Ottawa-Hull CMA into its Quebec part and Ontario part.

(4) The postcensal population estimates are prepared by the Population Estimates Section, Demography Division, Statistics Canada.

## MÉTHODOLOGIE

La projection a été faite à l'origine pour chacune des 24 régions métropolitaines de recensement (RMR) du pays et pour la partie non métropolitaine de chaque province, soit un ensemble de 37 régions(3). À l'exception de l'Île-du-Prince-Édouard et des deux territoires où il n'existe aucune RMR et, où les effectifs sont projetés directement, les effectifs provinciaux sont obtenus en faisant la somme des effectifs des régions métropolitaines et de la partie non métropolitaine pour chaque province. Les effectifs obtenus pour chacune des régions métropolitaines devront éventuellement faire l'objet d'une analyse et d'évaluation détaillée et donc ne sont pas inclus dans le présent rapport.

L'approche qui a été retenue est fondée sur la méthode des composantes régionales, comme par le passé. Cette approche comporte deux étapes: dans un premier temps, une analyse et extrapolation de chacune des composantes de la croissance (soit la fécondité, la mortalité et la migration, interne et internationale) est effectuée à partir de paramètres démographiques appropriés. On applique ensuite ces paramètres sous forme de taux ou de rapports à la population de l'année de départ de façon à obtenir, pour chaque région, les effectifs projetés selon l'âge et le sexe. La population de départ est la population estimée au 1<sup>er</sup> juin 1983 (estimation postcensitaire)(4). Dans un deuxième temps, les effectifs au niveau national et/ou provincial sont obtenus par sommation des effectifs régionaux. Il s'agit donc d'une approche dite d'agrégation.

La projection de chaque composante sur une base annuelle est effectuée par le modèle de projection de Statistique Canada. Les résultats

(3) Selon le recensement de 1981, il existe 24 RMR et 12 régions non métropolitaines réparties dans les 10 provinces et les deux territoires, soit 36 régions au total. La 37<sup>e</sup> région est créée en divisant la RMR Ottawa-Hull en deux parties, la partie québécoise et la partie ontarienne.

(4) La Section des estimations démographiques de la Division de la démographie publie annuellement des estimations postcensitaires de population.

cohort basis for each sex by single years of age. Since the projections are developed by single years of age, the results are available for each year of the projection period.(5)

## FERTILITY PROJECTIONS

Although the fertility level in Canada has diminished to a low of 1.7 children per woman, it continues to be the most important demographic factor influencing population growth and the age structure. As in the past, the future growth and age structure of the population will depend heavily on the future course of fertility. The direction that fertility will take has been a subject of considerable discussion and speculation in recent years. Much of the discussion has focussed on whether fertility will continue to fall, whether it will stabilize, or whether it will rise again, adding yet another upward cycle similar to the post-war baby-boom. Consideration has been given to these three possibilities in the development of the three fertility assumptions (high, low and constant) in the present projections.

### Methodology

The application of the projection model requires a set of projected age-specific fertility rates. By applying the projected age-specific fertility rates to the females of corresponding childbearing ages, the total births are derived. The fertility age schedule was projected by applying the parametric model (Romaniuk, 1975) based on three indices: (1) total fertility rate, measuring the level of fertility; (2) mean age of fertility; and (3) modal age of fertility; the latter two provide a convenient measure of the age pattern of childbearing. The main task for the application of the model was an in-depth analysis of each of these parameters and the formulation of assumptions on their future course during the projection period.

### Assumptions

The assumptions on the parameters of fertility were made first at the national level and the values were derived for the provinces and territories using the province/Canada ratios. Because of the lesser

sont fournis par âge et sexe, pour chaque année(5).

## PROJECTION DE LA FÉCONDITÉ

Même si la fécondité au Canada a atteint le niveau le plus faible de son histoire (1.7 enfant par femme), elle représente toujours le facteur le plus important dans l'évolution de la population et dans les mouvements de la structure par âge. Comme par le passé, ils seront intimement liés à l'évolution de la fécondité, laquelle a fait l'objet de nombreuses discussions et spéculations ces dernières années. On se demande surtout si la fécondité poursuivra sa baisse, si elle se stabilisera ou si elle augmentera pour créer un autre cycle, à l'instar de ce qui s'était produit après la Seconde Guerre mondiale. Ces trois possibilités ont été prises en compte dans l'élaboration des trois hypothèses relatives à la fécondité (forte, faible et constante).

### Méthode utilisée

La projection de la fécondité nécessite la détermination d'une série de taux de fécondité par année d'âge. Le produit de ces taux et de la population féminine en âge de procréer permet d'obtenir le nombre total de naissances. On projette la table de fécondité du moment en appliquant un modèle paramétrique (Romaniuk, 1975) fondé sur trois indices. Le premier de ces indices décrit l'intensité de la fécondité, soit l'indice synthétique; les deux autres, l'âge moyen et l'âge modal à l'accouchement, permettent de déterminer le calendrier de la fécondité. L'utilisation de ce modèle requiert une analyse détaillée de chacun des paramètres et la formulation d'hypothèses relatives à leur évolution au cours de la période de projection.

### Hypothèses

Il s'agissait en premier lieu d'élaborer les hypothèses relatives à la fécondité au niveau national; on a calculé ensuite les valeurs pour les provinces et les territoires par la méthode des rapports. Étant donné la faible incidence du

(5) For details on the general methodology and projection algorithm, see **Technical Report on Population Projections for Canada and the Provinces, 1972-2001** Catalogue No. 91-516, 1975, pp. 21-37.

(5) On trouvera plus de détails sur l'algorithme de projection dans le **Rapport technique sur les projections démographiques pour le Canada et les provinces, 1972-2001**; n° 91-516 au catalogue, 1975, pp. 21-37.

role played by the age pattern of fertility in the projection of births, assumptions concerning the mean and modal ages of fertility have been simplified by maintaining a constant pattern as observed in the most recent year. The trends in these two parameters have become rather unpredictable since, with the availability of more effective fertility control measures, women are able to control their fertility and adapt their decisions to the prevailing socio-economic situation. It has therefore been assumed that the 1981 values of mean and modal ages of fertility for Canada and the provinces, would remain constant for the projection period.

The fertility levels and trends in terms of the total fertility rate are the prime targets of the analysis underlying the formulation of the future fertility assumptions. The following three assumptions are made:

**Low assumption.** Total fertility rate for the country continues to decline from 1.7 children per woman in 1981 to 1.4 by 1996 and remains constant thereafter.

**High assumption.** Total fertility rate remains constant at 1.7 up to 1986 and then increases to 2.2 by 1996 and remains constant thereafter.

**Constant assumption.** Total fertility rate remains constant at the 1983 estimated level of 1.7 throughout the projection period.

The projected total fertility rates were derived for the years between 1983 and 1996 by linear interpolation.

From the assumed national fertility levels, the projected total fertility rates for each province/territory were estimated by a ratio approach. Based on the trend analysis of converging patterns, the total fertility rates for the provinces have been made to converge gradually toward the national level.

## Rationale of the Assumptions

### Low Fertility Assumption

If the post-World War II baby-boom can be taken as a deviation in the long-term trend in fertility, it may be reasonable to assume that the overall fertility level will continue to fall and probably remain low. There are three specific considerations reinforcing this assumption.

calendrier de la fécondité sur le nombre des naissances, on a simplifié les hypothèses relatives aux âges moyen et modal à l'accouchement en les maintenant constants au niveau observé au cours des dernières années. Il est présentement difficile de prévoir l'évolution de ces deux paramètres, car avec des moyens contraceptifs plus efficaces, les femmes peuvent mieux contrôler et planifier la venue des enfants en fonction de la situation socio-économique qui les affecte. On a donc supposé que les valeurs observées en 1981 pour ces paramètres demeureraient constantes pour la période de projection.

Les hypothèses sont fondées principalement sur l'analyse des niveaux et des tendances de la fécondité, exprimés en termes d'indice synthétique. Les trois hypothèses suivantes ont été retenues:

**Hypothèse faible.** L'indice synthétique de fécondité pour l'ensemble du pays poursuivrait sa baisse, passant de 1.7 en 1981 à 1.4 en 1996 et demeurerait constant par la suite.

**Hypothèse forte.** L'indice synthétique de fécondité se maintiendrait à 1.7 naissance par femme jusqu'en 1986, s'élèverait à 2.2 naissances en 1996 et resterait constant par la suite.

**Hypothèse constante.** L'indice synthétique de fécondité est maintenu à 1.7, niveau estimé en 1983, et ce, pour toute la période de projection.

Les indices synthétiques de fécondité pour la période 1983-1996 ont été obtenus par interpolation linéaire.

L'indice synthétique de fécondité de chaque province et territoire a été calculé, par la méthode des rapports, d'après les valeurs définies au niveau national. À partir d'une analyse des mouvements de convergence, on a supposé que la fécondité des provinces allait se rapprocher graduellement du taux de l'ensemble du pays.

## Justification des hypothèses

### Hypothèse faible

Si l'explosion démographique consécutive à la Seconde Guerre mondiale peut être considérée comme une anomalie dans l'évolution à long terme de la fécondité, il est raisonnable de supposer que la fécondité continuera à baisser et restera probablement faible. Trois considérations particulières viennent étayer cette hypothèse.

First, it has been hypothesized that fertility will decline in response to further improvement in women's economic status (Butz and Ward, 1979). The participation of women in the work-force is likely to escalate because of the dynamics of social change surrounding the role of women in our society. The actual rate at which females enter the work-force will, however, largely depend on the evolving economic situation and the way women react to it. It is likely that this rate will increase substantially in an expanding economy. The job opportunities would be better and more attractive to many women. But even if the economy remains sluggish and job opportunities expand only slowly, the rising expectations for an improved life-style will exert enough pressure on women to engage in gainful activities in great numbers. In either case, it is expected that the rate of female participation in the labour force will increase in the years to come. The Department of Finance (1980, pp. 46 and 47) has projected that by the turn of the century, 65% to 71% of women aged 20 and over will be part of the work-force as compared with the rate of 53% in 1983. Since children are intensive users of mothers' time, the opportunity cost of childbearing and rearing is greater for women who are employed or are looking for work.

Second, over the past decade several notable changes affecting marriage and divorce have occurred which should exert a negative influence on the fertility rate. Marriage rates have declined and divorce rates have increased substantially, particularly for the prime marriage ages, decreasing the population exposed to the risk of marital pregnancy.

Third, fertility may continue to decline due to a further reduction in unwanted pregnancies resulting from the availability of highly dependable contraceptives and the greater proportion of people resorting to sterilization and other means of birth control (Romaniuc, 1984).

The question is then, how much more of a decline in fertility rates could be expected in Canada? If the recent experience of Western European countries can be taken as a guide, it would not be unreasonable to anticipate a further decline in the total fertility rate to 1.4. In fact, in the Federal Republic of Germany, the total fertility rate has fallen as low as 1.35 births per woman. Denmark, Switzerland and a few other European countries have also achieved a fertility of about the same level. In Canada, five of the large metropolitan areas (Toronto, Montréal, Ottawa,

Premièrement, il est plausible que la fécondité poursuive sa baisse en raison de l'amélioration de la situation économique des femmes (Butz et Ward, 1979). Il y a, en effet, de fortes chances pour que la participation des femmes au marché du travail continue à augmenter par suite de changements dans les valeurs sociales quant au rôle de la femme. Toutefois, le rythme auquel les femmes y accèderont dépendra de la situation économique et de la façon dont elles réagissent à cette situation. Il est possible que ce rythme s'accélère considérablement dans une économie en expansion. Des emplois plus nombreux et plus intéressants pourraient inciter les femmes à entrer sur le marché du travail. Mais même si l'économie demeure stagnante et que les possibilités d'emploi restent faibles, l'aspiration à un niveau de vie plus élevé poussera bon nombre de femmes à prendre des emplois rémunérés. Dans l'un ou l'autre cas, on s'attend à ce que le taux d'activité chez les femmes augmente au cours des prochaines années. A la fin du siècle, selon les projections du ministère des Finances (1980, pp. 46 et 47), 65% à 71% des femmes âgées de 20 ans ou plus seront sur le marché du travail, contre 53% à l'heure actuelle. Étant donné le temps et l'énergie requis par le soin des enfants, le "coût" lié à la maternité s'élève dans le cas des femmes qui ont un emploi à l'extérieur du foyer ou désirent en obtenir un.

Deuxièmement, les bouleversements survenus au chapitre de la nuptialité au cours des 10 dernières années, devraient exercer une influence négative sur le taux de fécondité. En effet, on assiste à une baisse des taux de nuptialité pendant qu'il se produit un accroissement considérable du nombre de divorces, surtout chez les jeunes adultes, ce qui diminue la population susceptible d'avoir des enfants.

Troisièmement, la fécondité pourrait continuer à diminuer en raison d'une réduction du nombre de grossesses non désirées vu la possibilité de se procurer des contraceptifs efficaces et de recourir à la stérilisation ou à d'autres mesures contraceptives (Romaniuc, 1984).

Alors dans quelle mesure la fécondité pourrait-elle encore diminuer au Canada? Si l'on se base sur les études qui ont été menées en Europe occidentale, on peut raisonnablement prévoir un recul de l'indice synthétique de fécondité jusqu'à 1.4. En fait, en Allemagne de l'Ouest, il a même atteint 1.35 naissance par femme. D'autres pays de l'Europe de l'Ouest, notamment la Suisse et le Danemark, ont un indice de fécondité voisinant cette valeur. Au Canada, dans cinq grandes régions métropolitaines (Québec, Montréal, Ottawa, Toronto et Victoria) l'indice de fécondité approche déjà 1.4 enfant par femme et il se peut que le reste du pays atteigne ce

Victoria, Québec) have already achieved a fertility level close to 1.4 children per woman and suggests the possibility that fertility in the rest of the country may gradually diminish to this level over the next 10 to 15 years.

### High Fertility Assumption

Some experts argue that the current baby-bust has been caused partially by the postponement of births rather than a decision not to have children. Some women may actually forgo having the children that they now consider simply postponed. While it is possible that many of the births postponed during the late 1960s and 1970s will never materialize, it is possible that some may be made up by the end of the current decade, thus bringing about at least a modest rise in the fertility rate. The slight increase in fertility for 1982 in some of the provinces may be indicative of an attempt to catch up on the postponed births.

The potential upturn in fertility may also be intensified in the early 1990s when the baby-bust cohorts reach working age. Because of their smaller numbers, these cohorts may find themselves in a less competitive environment than their baby-boom predecessors, consequently, their relative economic position may improve making them more inclined to marry and have children early in their lives and in larger numbers (Easterlin, 1980). The expected economic recovery may also reinforce the effects.

In addition, if institutional solutions are found to ease the pressure on women arising from the dual pursuit of motherhood and employment, their involvement in work outside of the home could become less of an impediment to childbearing. An increase in fertility resulting from various pronatalist policies was witnessed in recent years in several Eastern European countries.

Because of various countervailing forces, it seems unlikely that there will be a full revival of the 1946-1964 baby-boom when the total fertility rate ranged between 3.4 and 3.9 births per woman. However, a modest rise in the fertility rate, as assumed, is considered plausible for the reasons indicated above.(6)

(6) It may be noted that a total fertility level of 2.3 children per woman is considered a plausible scenario for the latest population projections by the U.S. Bureau of the Census (1984, p. 17).

niveau au cours des 10 ou 15 prochaines années.

### Hypothèse forte

Certains experts sont d'avis que la chute de la fécondité actuelle résulte, en partie, de l'ajournement des naissances plutôt que d'une décision bien arrêtée de ne plus avoir d'enfant. Certaines femmes, qui considèrent actuellement reporter la maternité, peuvent finir par y renoncer. Il se peut, toutefois, que l'ajournement des naissances au cours des années 1960-1970 soit compensé d'ici la fin de la décennie, provoquant ainsi une faible augmentation de la fécondité. Celle qu'ont connue quelques provinces en 1982 donne à penser que l'on effectue un certain "rattrapage".

Il est aussi possible que l'accroissement éventuel de la fécondité soit plus élevé au début des années 90, lorsque les générations issues de la période de faible fécondité atteindront l'âge de travailler. Comme ces générations sont moins nombreuses que celles qui les ont précédé, leurs membres pourront se trouver dans un environnement moins compétitif et bénéficier d'une situation économique relativement meilleure; il se peut aussi qu'ils tendent à se marier et à avoir des enfants plus jeunes et en plus grand nombre (Easterlin, 1980). La reprise escomptée de l'économie pourrait donner des résultats similaires.

De plus, si des mesures sociales venaient alléger la charge associée au cumul de la maternité et d'un emploi, le travail à l'extérieur du foyer ferait, possiblement, moins obstacle à la procréation. Une hausse de fécondité, résultat de l'application de politiques natalistes, a été observée dans plusieurs pays de l'Europe de l'Est.

En raison des diverses forces compensatoires, il semble peu probable que l'on connaisse à l'avenir une explosion démographique semblable à celle du baby-boom des années 1946-1964, où la fécondité variait entre 3.4 et 3.9 naissances par femme. Cependant, une hypothèse de faible augmentation du taux de fécondité est plausible pour les raisons indiquées ci-dessus(6).

(6) On peut noter qu'un indice synthétique de fécondité de 2.3 enfants par femme est considéré, par le U.S. Bureau of the Census, dans ses dernières projections de population, comme un scénario plausible (1984, p. 17).

### Constant Fertility Assumption

There is also some indication that fertility in North America is tending to stabilize. Indeed for the past five or six years, there has been no significant change in the fertility rate in Canada or the United States, and the expected family size, as revealed from surveys, has remained basically stable. Hence, there is some evidence to support the assumption that the procreative behaviour of North American women remains unchanged and that Canadian fertility may stabilize at the current level.

### Concluding Comments

The observed and projected total fertility rates under the three assumptions for Canada, the provinces and territories, 1971 to 1996 are shown in Table 1 and Figure 1 (Canada only).

### Hypothèse constante

Tout porte à croire que la fécondité au Canada et aux États-Unis tend à se stabiliser. En fait, au cours des cinq ou six dernières années, le taux de fécondité dans ces pays n'a pas varié de façon notable. De plus, il ressort de certaines enquêtes que la taille idéale de la famille est demeurée à peu près stable au cours des dernières années. Il y a donc certains faits qui étayent l'hypothèse d'un comportement procréateur qui demeurera sensiblement le même et du maintien de la fécondité au niveau actuel, chez les femmes nord-américaines.

### Conclusion

Les indices synthétiques de fécondité pour le Canada, les provinces et les territoires, de 1971 à 1996, selon trois hypothèses, sont présentés au tableau 1 et à la figure 1 (Canada seulement).

There are many imponderables in fertility forecasting which are compounded by the ever-changing socio-economic and psychological factors affecting human reproduction. These cannot be accurately predicted on the basis of the present knowledge. Although an upward trend in fertility cannot be ruled out with a radical societal change in the outlook on life, all current indications suggest that future trends in fertility are

La projection de la fécondité comporte de nombreux impondérables, les facteurs socio-économiques et psychologiques qui affectent la reproduction humaine étant en constante évolution. Il est impossible de les déterminer avec précision d'après les connaissances dont on dispose actuellement. Même si un relèvement de la fécondité est toujours possible, ce qui demanderait des transformations substantielles dans le mode de vie, les données actuelles laissent croire que

likely to operate around the present low level of childbearing. As observed by Westoff (1983, p. 102), "no social changes are on the horizon that would lead to the expectation that the fertility rate will increase substantially (to a total fertility rate greater than 2.5, for example). More likely is the continuation of rates at or below replacement, and in some instances these rates may indeed fall closer to the one- than to the two-child average".

## MORTALITY PROJECTIONS

Compared to the fertility and migration components of the projection model, the mortality projections are less crucial to the projection of total population size. This is because the overall death rate is already quite low and further reductions will probably be moderate. However, from the point of view of the age-sex structure of the population, the mortality projections assume greater importance due to the age-specific differences in mortality. There have been some significant changes in the age-specific mortality pattern between 1976 and 1981. These changes in the most recent period have been taken into account in the current mortality projections. However, unlike the other components, only a single assumption is made for mortality projections.

### Projection Methodology

In the previous two Statistics Canada population projections, the approach adopted for mortality projections was based on trends in cause-specific mortality since 1951 (Statistics Canada, 1979, Catalogue No. 91-520, p. 19; and Gnanasekaran, 1975). The development of mortality assumptions in terms of trends in either age-specific mortality rates or cause of death by age and sex at the national or subnational level is a complex operation. Furthermore, in this approach change in the expectation of life at birth ( $e_0$ ) can be derived only after the assumptions regarding age-specific rates have been determined. Such a procedure of treating life expectancy as a derived parameter makes this approach less flexible, for in most cases, users prefer to express their assumptions regarding mortality change in terms of change in life expectancy at birth. For the present projections, this approach has been replaced by a simpler and relatively more flexible method which facilitates faster updating and the accommodation of user-specified assumptions.

la fécondité dans l'avenir pourrait fluctuer de part et d'autre des niveaux très faibles que l'on connaît présentement. Comme l'a fait observer Westoff (1983, p. 102), "aucune perspective de changement social ne porte à penser que la fécondité augmentera sensiblement (pour dépasser 2.5, par exemple). Il est plus probable que la fécondité demeurera au niveau du seuil de remplacement ou au-dessous de celui-ci, ce qui pourrait se traduire par un plus grand nombre de familles ayant un enfant en moyenne plutôt que deux".

## PROJECTION DE LA MORTALITÉ

L'impact de la projection de la mortalité sur la détermination de la population totale est moindre que dans le cas des autres composantes du modèle (fécondité et migration), car en général la mortalité est déjà très faible et ne pourrait guère baisser davantage. Cependant, lorsqu'il s'agit de déterminer la répartition de la population par âge et par sexe, la projection de la mortalité prend une importance accrue en raison de la fréquence variable des décès selon l'âge. Au cours de la période 1976-1981, le schéma de la mortalité selon l'âge s'est considérablement modifié. On a tenu compte de l'évolution observée pendant la période la plus récente pour la projection actuelle; cependant, contrairement aux autres composantes, une seule hypothèse de mortalité a été posée.

### Méthode utilisée

Dans les projections faites antérieurement par Statistique Canada, la méthode retenue dans le cas de la mortalité était fondée sur l'évolution du phénomène depuis 1951, selon les causes de décès (publication n° 91-520 au catalogue de Statistique Canada, 1979, p. 19; et Gnanasekaran, 1975). L'élaboration d'hypothèses d'après l'évolution des taux de mortalité selon la cause de décès, l'âge et le sexe, au niveau national ou régional, est un processus long et complexe. Par ailleurs, dans cette approche, les gains en espérance de vie à la naissance ( $e_0$ ) ne peuvent être déterminés qu'après avoir établi les hypothèses concernant les taux de mortalité selon l'âge. Cette façon de procéder est moins souple, car on y considère l'espérance de vie comme un paramètre dérivé, alors que dans la plupart des cas, les utilisateurs préfèrent exprimer leurs hypothèses concernant l'évolution de la mortalité sous forme de gains d'espérance de vie à la naissance. Pour les projections actuelles, une démarche plus simple et flexible a été adoptée afin de répondre rapidement aux demandes des utilisateurs et de rendre plus facile la mise à jour des projections.

In the present approach, assumptions are made directly in terms of changes in life expectancy at birth ( $e_0$ ). These changes are then translated into changes in age-specific survival ratios in a manner consistent with the most recent age pattern of change in mortality.

The method may be briefly described as follows:

The age distribution of a life table population ( $L_x$ ) is entirely determined by mortality since the effect of fertility is held constant and since every member of the population must eventually die. Life expectancy at birth ( $e_0$ ), therefore, corresponds to the ratio of annual person-years lived by the population to annual life table births. This ratio is equivalent to the ratio of population size,  $L_{0+}$  ( $L_{0+} = T_0$ , the sum of  $L_x$  over all ages) to annual life table births,  $l_0$ , which is generally set at 100,000.

A change in life expectancy at birth corresponds to a change in life table population size. That is, if life expectancy increases by exactly  $de_0$  in five years, the future life table population size would be:

$$L_{0+}^{y+5} = L_{0+}^y + 100,000 \, de_0 \quad (1)$$

where  $L_{0+}^y$  is the base year life table population size; and

$$de_0 = e_0^{y+5} - e_0^y$$

where  $y$  = the year of the life table.

Assuming further that there is no change in the age pattern of mortality improvement, the proportion of the population increase at each age may be calculated from the comparison of two previous life tables. That is,  $A_x$ , the proportion of person-years added to the population at age  $x$  or the distribution of change in life expectancy at different ages in a given period will be:

$$A_x = \frac{L_x^{y+5} - L_x^y}{L_{0+}^{y+5} - L_{0+}^y} \quad (2)$$

Dans le cas présent, les hypothèses sont donc formulées directement sous forme de gains en espérance de vie à la naissance ( $e_0$ ). Ces gains sont exprimés ensuite en termes de probabilités de survie selon l'âge, reflétant l'évolution la plus récente de la mortalité selon l'âge.

Voici une brève description de cette méthode:

La structure par âge de l'effectif de la population stationnaire d'une table de mortalité ( $L_x$ ) dépend entièrement du nombre de décès puisque l'incidence de la fécondité est maintenue constante et que chaque membre de l'effectif décèdera éventuellement. Par conséquent, l'espérance de vie à la naissance ( $e_0$ ), correspond au rapport du nombre de personnes-années vécues à l'effectif annuel des naissances de la table. Ce rapport équivaut à celui de la taille de la population,  $L_{0+}$  ( $L_{0+} = T_0$ , la somme des  $L_x$  tous âges) au nombre annuel de naissances de la table de mortalité,  $l_0$ , établi généralement à 100,000.

Un changement dans l'espérance de vie à la naissance se traduit par une modification de la taille de la population stationnaire d'une table de mortalité. Ainsi, si l'espérance de vie augmente de  $de_0$  en cinq ans, la taille de la population stationnaire sera:

où  $L_{0+}^y$  = l'effectif de la population stationnaire de l'année de départ; et

où  $y$  = l'année visée par la table de mortalité.

Si l'on suppose, de plus, que la structure de l'évolution de la mortalité selon l'âge ne change pas, la proportion de l'accroissement de la population à chaque âge peut être calculée à partir du rapprochement de deux tables de mortalité. Ainsi,  $A_x$ , la proportion de personnes-années vécues qui seront ajoutées à la population à l'âge  $x$  ou encore la répartition par âge d'une variation donnée de l'espérance de vie sera:

Future survival ratios which are consistent with the current age pattern of mortality improvement and with a specified increase in life expectancy ( $d^e_0$ ) may be determined by:

$$\frac{L_x^{y+n}}{L_{x-1}^{y+n}} = \frac{L_x^y + 100,000 A_x (d^e_0)}{L_{x-1}^y + 100,000 A_{x-1} (d^e_0)} \quad (3)$$

where  $n$  = the number of years between the base year and the projected year.

By employing this method, user-specified assumptions may be accommodated either in terms of future life expectancies, or in special cases, where there is a concern with special age groups, assumptions could be expressed about change in the age pattern of mortality improvement ( $A_x$ ).

Des probabilités de survie, compatibles avec la structure actuelle de la mortalité selon l'âge et une augmentation donnée de l'espérance de vie ( $d^e_0$ ) peuvent être calculées par l'équation suivante:

où  $n$  = le nombre d'années de la période de projection.

L'utilisation de cette méthode permet de transposer les hypothèses fournies par les utilisateurs sous forme d'espérance de vie ou, dans le cas de certains groupes d'âge particuliers, sous forme de variations dans la structure par âge de la mortalité ( $A_x$ ).

TABLE 2. Per Cent Distribution of Change in Life Expectancy at Birth by Age and Sex, Canada, 1971-1976 and 1976-1981

TABLERAU 2. Répartition par âge et sexe des gains d'espérance de vie à la naissance, Canada, 1971-1976 et 1976-1981

Age - Âge	Male - Hommes		Female - Femmes	
	1971-1976	1976-1981	1971-1976	1976-1981
0-19	14.79	5.90	7.71	5.86
20-39	15.69	9.79	9.81	7.61
40-59	20.70	20.77	15.24	13.18
60-69	16.11	19.44	12.57	10.95
70-79	20.12	22.29	20.51	17.72
80+	12.59	21.81	34.16	44.68
Total	100.00	100.00	100.00	100.00

**Note:** The figures presented were calculated from  $L_x$  values using equation (2). The procedure consists in calculating the gain in  $L_x$  over a period, for a given age,  $x$ , and expressing it as a percentage of the total gain (for all ages together) in  $L_x$ . Thus, over the 1976-1981 period, the value for males 0-19 age group is as shown below:

**Nota:** Les proportions  $A_x$  ci-dessus ont été calculées à partir de la fonction  $L_x$  dans l'équation (2). La procédure consiste à calculer pour un âge donné  $x$ , le gain en  $L_x$  sur une période donnée, et à l'exprimer sous forme de pourcentage du gain total (i.e., tous âges). Ainsi, pour la période 1976-1981, la valeur pour le groupe 0-19, sexe masculin, est obtenue ainsi:

$$\frac{L_{0-19}^{1981} - L_{0-19}^{1976}}{L_{0+}^{1981} - L_{0+}^{1976}} \times 100 = \frac{(1,969,815 - 1,959,835)}{(7,187,664 - 7,018,551)} \times 100 = 5.90\%$$

**Source:** Statistique Canada, Tables de mortalité, Canada et provinces, 1970-1972, 1975-1977, 1980-1982, n° 84-532 au catalogue, hors série.

## Assumptions and Rationale

An examination of mortality trends in Canada between 1976 and 1981 suggests that important differences have emerged in the mortality pattern during this period compared with earlier periods. The new age pattern involves a substantial improvement in the mortality of males over 40 and females over age 80 (Table 2). While changes may be observed in both male and female life tables, they are more pronounced for males. In the past, mortality improvements were mainly confined to the very young, especially for males. A further characteristic of the recent improvement is that mortality among males under age 40 now more closely resembles that of females, while in the past there was a striking difference between the two.

Coincident with these shifts in the age pattern of mortality change, there appears to have been a marked increase in the rate of change as represented by gains in life expectancy. For Canada as a whole and for each province generally, the estimates of life expectancy for 1981 suggest increases in the 1976-1981 interval that are considerably greater than have been previously observed. Between 1976 and 1981, male and female life expectancies at birth increased by 1.7 and 1.5 years, respectively. This increase for males was almost double that of the previous quinquennial period (Table 3). As a result, the difference between male and female life expectancy narrowed down slightly for the first time between 1976 and 1981.

On the basis of the observed mortality changes by age and sex between 1976 and 1981, and the following underlying assumptions, the mortality level and pattern presented in Table 3 were determined.

- (1) Future changes in life expectancy are assumed to be lower at the national level for both males and females than those recorded for 1976-1981.
- (2) Given the striking changes in male mortality age patterns as compared to those of females, and on the basis of current changes taking place in conditions of life among females (e.g., duration, pattern and levels of labour force participation), it is assumed that higher rates of change will be maintained for a longer period among males than among females. This implies a slight narrowing of the differences between male and female mortality in the future.
- (3) Considering the greater similarity in the age patterns of current mortality between males and females, especially in

## Hypothèses

L'examen de l'évolution de la mortalité au Canada entre 1976 et 1981 révèle d'importantes différences entre la période à l'étude et les périodes antérieures. En effet, le nouveau schéma par âge montre une nette amélioration aux âges avancés, pour les plus de 40 ans chez les hommes et les plus de 80 ans chez les femmes (tableau 2). Même si des changements peuvent être notés dans les tables de mortalité tant pour les effectifs féminins que masculins, ils sont plus prononcés chez ces derniers. Par le passé, le recul de la mortalité était principalement observé chez les très jeunes, surtout dans le cas des hommes. Une caractéristique de la situation récente se traduit par un rapprochement entre la mortalité des hommes et des femmes aux âges inférieurs à 40 ans, alors qu'il existait jusqu'à maintenant un écart marqué entre les deux.

Il semble que, en même temps que se produisent des modifications de la structure par âge, il y ait un accroissement marqué du taux de variation comme le montrent les gains en matière d'espérance de vie. En 1981, pour le Canada et les provinces, les valeurs estimées de l'espérance de vie suggèrent des améliorations substantielles pour la période 1976-1981 comparativement à ce qui avait été observé auparavant. Entre 1976 et 1981, l'espérance de vie à la naissance a augmenté de 1.7 an chez les hommes et de 1.5 an chez les femmes. Cet accroissement chez les hommes est presque le double de celui enregistré les cinq années précédentes (tableau 3). L'écart qui existe entre les hommes et les femmes sur le plan de l'espérance de vie a donc légèrement diminué pour la première fois entre 1976 et 1981.

D'après les variations dans la mortalité selon l'âge et le sexe, observées entre 1976 et 1981, et les hypothèses ci-dessous, on a déterminé le niveau de mortalité et les tendances qui figurent au tableau 3.

- (1) Au niveau national, les gains en matière d'espérance de vie dans l'avenir sont supposés inférieurs à ceux qui ont été enregistrés pour 1976-1981 chez les hommes et les femmes.
- (2) Étant donné la forte variation des structures par âge de la mortalité chez les hommes par rapport aux femmes et compte tenu des changements survenus dans le mode de vie de ces dernières (durée et niveau d'activité), l'on présume que les taux de variation resteront plus élevés pour une plus longue période chez les hommes que chez les femmes. Cela signifie que l'écart qui existe entre les hommes et les femmes sur le plan de la mortalité diminuera légèrement à l'avenir.
- (3) Comme les structures par âge de l'évolution de la mortalité chez les hommes et les femmes sont actuellement plus rapprochées, l'on

the very young and upper ages, it is assumed that these remain relatively fixed in the future.

- (4) Given the unusual character of the most recent changes and the inevitable uncertainties associated with the interpretation of provincial trend differentials estimated from a single census interval, a cautious assumption has been adopted which holds provincial differentials constant over the projection period.

présume qu'elles demeureront relativement les mêmes dans l'avenir.

- (4) Étant donné le caractère particulier de l'évolution récente de la mortalité et l'incertitude inévitable associée à l'interprétation des différences provinciales, estimées pour une seule période quinquennale, une hypothèse prudente, selon laquelle les différences provinciales restent constantes pour la période de projection, a été retenue.

**Source:** 1971-1981: Statistique Canada, *Tables de mortalité, Canada et provinces, 1970-1972, 1975-1977, 1980-1982*; n° 84-532 au catalogue, hors série; 1986, 1991 et 1996, valeurs projetées.

It can be seen that male gains in life expectancy have been held constant at one additional year of life per five-year period, up to 1996. Female changes in life expectancy will decline to 0.8 additional years of life per five-year period after 1986, from a level equal to that of males in the 1981-1986 interval. Thus, male life expectancy is assumed to increase at a greater pace than females from 71.9 years in 1981 to 74.9 by 1996, a gain of three years. Females, whose life expectancy was

On peut voir que l'espérance de vie chez les hommes augmente de façon constante au rythme d'un an pour chaque période de cinq ans et ce, jusqu'en 1996. Chez les femmes, les gains diminuent, passant à 0.8 an par période de cinq ans après 1986, alors qu'en 1981-1986 l'accroissement correspond à celui observé chez les hommes. Ainsi, on pose par hypothèse que l'espérance de vie augmentera plus rapidement chez les hommes que chez les femmes, passant de 71.9 ans en 1981 à 74.9 en 1996, soit un gain de trois ans. Celle des femmes, de presque 79.0 ans en 1981, devrait

close to 79.0 years in 1981, are expected to attain a life expectancy of 81.6 years by 1996, a total gain of 2.6 years.(7) The assumed life expectancy levels for Canada are greater than those for the latest U.S. population projections under the high and middle mortality assumptions.(8) Researchers on mortality are generally of the view that life expectancy will rise further and suggest a bolder assumption on mortality improvement in the future (Jean Bourgeois-Pichat, 1978, pp. 12-41).

Absolute changes in mortality are assumed to be identical across the provinces, but since these are expressed in terms of years of life expectancy, they imply somewhat higher proportionate change among provinces with lower initial life expectancies. Similarly, relatively high rates of change in age-specific mortality are also implied for provinces with relatively high initial mortality levels.

The territories (Yukon and the Northwest Territories) have been treated separately. It has been assumed that these areas will improve faster than the national average, in part because they have more to gain; gains of 1.50 and 1.25 years for males and females respectively, were assumed for each five-year period for both the territories.

## INTERNATIONAL MIGRATION PROJECTIONS

Unlike internal migration, which directly affects the population only at the subnational level, international migration affects the population growth, structure and distribution at both the national and subnational levels. There are two components of international migration. They are: immigration and emigration. These were projected separately.

### Projection Methodology

The basic methodology adopted for the current projections can be described as follows: (i) numbers of immigrants and emigrants were projected at the Canada

(7) The views among experts are divided as to whether the sex differential in mortality will narrow or widen. One group is of the view that the differential may narrow by several years and the other group believes that it may widen to 10 or 12 years by the turn of the century (U.S. Bureau of the Census, 1984, p. 18).

(8) In the United States, male and female life expectancy is projected to increase from 70.6 years and 78.1 years in 1982 to 72.9 years and 80.5 years in 2000, respectively in the middle series (U.S. Bureau of the Census, 1984, p. 17).

atteindre 81.6 ans en 1996, ce qui représente un allongement de 2.6 ans(7). L'espérance de vie projetée pour le Canada est plus élevée que celle prévue dans les dernières projections américaines selon les hypothèses de mortalité forte et moyenne(8). Les spécialistes en la matière sont généralement d'avis que l'espérance de vie augmentera encore et proposent une hypothèse plus audacieuse concernant la diminution de la mortalité à l'avenir (Jean Bourgeois-Pichat, 1978, pp. 12-41).

Les variations de la mortalité en valeurs absolues sont supposées identiques dans toutes les provinces, mais comme elles sont exprimées en années d'espérance de vie, elles sont proportionnellement plus fortes dans les provinces où l'espérance de vie est faible au départ. De même, les taux de variation de la mortalité selon l'âge sont relativement élevés dans les provinces qui ont, au départ, un taux de mortalité relativement élevé.

Les territoires (le Yukon et les Territoires du Nord-Ouest) ont été étudiés séparément. On suppose que dans ces régions l'espérance de vie augmentera plus rapidement que la moyenne nationale, en partie parce qu'un certain "rattrapage" doit être effectué (gains de 1.50 et 1.25 an pour les hommes et les femmes respectivement par période quinquennale).

## PROJECTION DE LA MIGRATION INTERNATIONALE

À la différence de la migration interne, qui influe directement sur les effectifs de population au niveau régional, la migration internationale joue un rôle dans l'accroissement démographique et affecte la structure par âge, tant à l'échelle nationale que régionale. Ses deux composantes, l'immigration et l'émigration, ont été projetées séparément.

### Méthode utilisée

La méthode adoptée pour la projection est la suivante: (i) des niveaux d'immigration et d'émigration, en valeurs absolues, sont projetés pour tout le Canada; (ii) ils sont ensuite ventilés

(7) Les spécialistes ne s'entendent pas sur la question à savoir si l'écart existant entre les hommes et les femmes sur le plan de la mortalité va s'atténuer ou s'accroître. Certains pensent qu'il peut diminuer de plusieurs années et d'autres croient, au contraire, qu'il sera de 10 ou 12 ans à la fin du siècle (U.S. Bureau of the Census, 1984, p. 18).

(8) Aux États-Unis, selon les projections, l'espérance de vie chez les hommes et les femmes passe respectivement de 70.6 ans et 78.1 ans en 1982 à 72.9 ans et à 80.5 ans en l'an 2000, d'après l'hypothèse moyenne (U.S. Bureau of the Census, 1984, p. 17).

level; (ii) these numbers were then distributed by provinces/territories according to an assumed distribution; and (iii) the projected numbers of immigrants and emigrants were then distributed according to assumed age-sex distributions.

### Assumptions

There are two assumptions on immigration levels and one assumption on emigration (Table 5). The assumptions are essentially

par province et territoire, selon une hypothèse de répartition; (iii) les niveaux d'immigration et d'émigration de chaque région sont enfin répartis par âge et par sexe à l'aide de structures types.

### Hypothèses

Deux hypothèses concernent les niveaux d'immigration et une, l'émigration (tableau 5). Elles reposent sur une analyse de l'évolution récente

TABLE 5. Immigration, Emigration and Net Immigration, Canada, 1971-72 to 2005-06

judgemental, based on an analysis of past trends together with a careful consideration of previously announced immigration target levels, current immigration policy and prospects of refugee and independent types of migration. Immigration is a controlled phenomenon, as it depends on the policy and the annual immigration targets of the government. The two assumptions on immigration and their rationale are as follows:

**Low assumption.** Although there has been a decline in immigration in recent years, the announced immigration target levels are given in a range for each year, which increase over the target period. The lower bound of the target levels announced for each year is the basis of the low assumption. Given the relative stability in numbers of family class immigrants and the increasing world refugee problem, immigration levels lower than 100,000 per year are considered unlikely in the long run. It is assumed that the current immigration would stabilize at about 100,000 by 1985-86 and remain constant at that level thereafter.

**High assumption.** The high assumption is intended to represent the scenario of a possible improvement in the economic situation - thereby increasing the demand for selected workers and a higher intake of refugees. The possibility of an increase in immigration to partly compensate for the prevailing low fertility level is also considered. It is assumed, therefore, that the immigration level would increase to 150,000 by 1994-95 and remain constant at that level thereafter.

**Emigration assumption.** Compared to immigration, much less is known about emigration from Canada. As in the past, for the current projections, emigration estimates prepared by Population Estimates Section, Demography Division, Statistics Canada, are used as a base for projecting future levels. These estimates are developed by a composite method based on family allowance data and income tax records (Statistics Canada, Catalogue No. 91-210, 1984). The estimates of emigration for the recent years show that the emigration level registered a decline from about 70,000 a year during 1971-1976 to about 50,000 after 1976. On the basis of the recent trends in emigration, it was decided to adopt a single assumption of 50,000 emigrants per year for the projection period (Table 5).

### Geographic Distribution of Immigrants

In distributing the immigrants by provinces and by age and sex, emphasis was placed on the trend observed in the last three years rather than the mean level based on a longer period. For both the low and high

de ces phénomènes ainsi que sur la prise en considération des niveaux d'immigration prévus par le ministère responsable de la politique en ce domaine et du nombre probable de réfugiés et d'immigrants indépendants. L'immigration est un phénomène contrôlé, assujéti à la politique et aux niveaux d'immigration fixés par le gouvernement. Les deux hypothèses sont les suivantes:

**Hypothèse faible.** Bien qu'il y ait eu une diminution du nombre d'immigrants au cours des dernières années, les quotas prévus sont fournis sous forme d'éventails qui augmentent graduellement au cours de la période visée. L'hypothèse faible est fondée sur les effectifs inférieurs des niveaux annoncés par le ministère. Compte tenu de la stabilité relative du nombre d'immigrants dans la catégorie des familles et de l'acuité du problème des réfugiés dans le monde, on peut considérer comme peu vraisemblable des niveaux d'immigration s'établissant, à long terme, à moins de 100,000 personnes par année. Il a donc été posé dans l'hypothèse faible que l'immigration pourrait atteindre 100,000 personnes en 1985-86 et se maintiendrait à ce niveau par la suite.

**Hypothèse forte.** L'hypothèse forte vise à refléter la possibilité d'un redressement de la situation économique, ce qui pourrait entraîner une demande accrue de travailleurs spécialisés et favoriser l'admission de réfugiés. La possibilité de compenser le manque à gagner de la faible fécondité actuelle par une hausse de l'immigration a aussi été considérée. Selon cette hypothèse, l'immigration augmenterait pour atteindre 150,000 personnes en 1994-95 et demeurerait à ce niveau par la suite.

**Émigration.** L'émigration au Canada est un phénomène beaucoup moins bien connu que le précédent. Comme par le passé, l'estimation des effectifs d'émigrants produite par la Section des estimations démographiques, Division de la démographie, est utilisée. Cette estimation est établie à partir de données tirées des fichiers des allocations familiales et de l'impôt (Statistique Canada, n° 91-210 au catalogue, 1984). Ces données montrent que le nombre d'émigrants a baissé, passant d'environ 70,000 par année pour la période 1971-1976 à quelque 50,000 après 1976. À la lumière de ces tendances récentes, l'hypothèse d'une émigration constante de 50,000 personnes par année, pour toute la période de projection a été retenue (tableau 5).

### Répartition géographique des immigrants

La répartition des immigrants par province, âge et sexe est établie à partir des situations observées au cours des trois dernières années plutôt que sur un niveau moyen d'immigration, calculé sur une plus longue période. Les niveaux

assumptions of immigration, national levels are distributed by provinces using the same set of provincial distributions. The assumed provincial distribution of immigrants is developed from a three-year average (1979-80, 1980-81 and 1981-82) of the data on the intended geographic destination of immigrants as published by Employment and Immigration Canada. Figure 2 and Table 6 give the corresponding assumed provincial proportions and numbers of immigrants, respectively. This three-year average of provincial distribution is kept constant for all the provinces except Quebec, Ontario, Alberta and British Columbia for the duration of the projection period. A changing distribution was assumed for these provinces as current trends were indicating a geographic distribution closer to the level of the early 1970s when Quebec and Ontario were receiving a higher share of immigrants than in the later years with corresponding reductions in Alberta and British Columbia. Such a varying distribution was not considered for the other provinces and the territories because these four provinces together receive a little over 90% of the total immigrants.

nationaux sont répartis par province, selon la même hypothèse de répartition, pour les hypothèses forte et faible. La répartition provinciale des immigrants est établie d'après une moyenne portant sur trois ans (1979-80, 1980-81 et 1981-82) calculée à partir des données sur la destination géographique prévue des immigrants fournies par Emploi et Immigration Canada. La figure 2 et le tableau 6 donnent respectivement les proportions et le nombre d'immigrants correspondants pour chaque province et territoire. Cette moyenne est gardée constante durant la période de projection pour toutes les provinces, à l'exception du Québec, de l'Ontario, de l'Alberta et de la Colombie-Britannique. Une répartition régionale spécifique a été développée pour ces provinces afin de tenir compte de changements récents indiquant un retour vers la distribution observée au début des années 1970, alors que le Québec et l'Ontario recevaient une plus forte proportion des immigrants qu'au cours des années subséquentes et que la Colombie-Britannique et l'Alberta enregistraient une proportion moindre. Puisque ces provinces accueillent à elles seules plus de 90% du nombre total d'immigrants, on n'a pas jugé nécessaire d'appliquer cette répartition particulière aux autres provinces et territoires.

TABLE 6. Assumed Distribution of Immigrants and Emigrants by Province and Territory, for the Projection Period(1)

TABLER 6. Répartition des effectifs nationaux d'immigrants et d'émigrants, par province et territoire pour la période de projection(1)

Saskatchewan	3,300	2,200	1,200
Alberta	13,500	9,000	6,000
British Columbia - Colombie-Britannique	21,700	14,500	5,550
Yukon	100	100	50
Northwest Territories - Territoires du Nord-Ouest	100	100	100
Canada	150,000	100,000	50,000

(1) These immigration values are assumed to be reached gradually, in 1987-88 for the low immigration assumption and in 1994-95 for the high immigration assumption, and are then kept constant. Values for emigration are assumed constant for the projection period. - Le nombre d'immigrants atteindra graduellement les valeurs indiquées, en 1987-88 dans l'hypothèse faible et en 1994-95 dans l'hypothèse forte; par la suite les valeurs sont maintenues constantes. Le nombre d'émigrants demeure constant durant toute la période de projection.

## Age-sex Distribution of Immigrants

For the low assumption of immigration, the projected numbers of immigrants for each province were distributed by age and sex, based on a three-year average (1980-81, to 1982-83) of the respective provincial age-sex distribution of immigrants. The assumed age-sex distributions were kept constant for the entire projection period. For the high immigration assumption, a younger age pattern was assumed for Ontario, Quebec, Alberta and British Columbia. For these four provinces, it was assumed that the average 1980-81 to 1982-83 age distribution will change linearly to the three-year average distribution of 1972-73, to 1974-75 by 1996. The additional assumption for the four provinces takes into consideration possible changes in age distribution in the future as a result of an increase in the independent type of immigrants who are concentrated in the young adult ages. Immigrants in the early 1970s were predominantly of the independent type with concentration in the young age groups.

## Geographic Distribution of Emigrants

As in the case of immigration, the national level of emigration is distributed by province/territory. The assumed provincial distribution of emigrants was based on a three-year average, 1979-80, 1980-81 and 1981-82. Figure 2 and Table 6 give the provincial proportions and numbers of emigrants respectively. The provincial average distribution, as obtained above, is kept constant for the duration of the projection period.

## Age-sex Distribution of Emigrants

Only one age-sex distribution of emigrants was used in distributing the projected number of emigrants by age and sex for each province/territory. The age-sex distribution of emigrants used was derived from a three-year average estimate for 1980-81, 1981-82 and 1982-83 based on two data sources - the Revenue Canada taxation file and U.S. immigration data.<sup>(9)</sup> The assumed average age-sex distribution is kept constant for the projection period.

(9) The emigration estimates based on the income tax file provided only broad age groups. These were distributed into single years of age using the detailed age distribution of Canadian immigrants to the United States. The age distributions based on income tax data are more representative of the total emigrants than those derived from the U.S. data.

## Répartition des immigrants selon l'âge et le sexe

Dans le cas de l'hypothèse faible, les effectifs d'immigrants sont répartis selon l'âge et le sexe, d'après une répartition provinciale moyenne sur trois ans (1980-81 à 1982-83). Cette répartition demeure constante pour toute la période de projection. Dans l'hypothèse forte, une structure par âge plus jeune est prévue pour le Québec, l'Ontario, l'Alberta et la Colombie-Britannique. Pour ces quatre provinces, l'on suppose que la répartition selon l'âge variera progressivement pour atteindre, en 1996, une répartition correspondant à celle observée au cours de la période 1972-73 à 1974-75. Cette hypothèse rend compte d'un éventuel rajeunissement dans la répartition selon l'âge qui pourrait résulter d'une augmentation du nombre d'immigrants dits indépendants plus fortement représentés dans les jeunes groupes d'âge. On sait en effet qu'au début des années 70, les immigrants dits indépendants représentaient une plus forte proportion de l'ensemble des immigrants.

## Répartition géographique des émigrants

Comme dans le cas de l'immigration, les effectifs d'émigrants nationaux sont répartis par province et territoire. La répartition régionale présumée des émigrants est effectuée à partir d'une moyenne sur trois ans (1979-80, 1980-81 et 1981-82). La figure 2 et le tableau 6 fournissent, respectivement, les proportions et le nombre d'émigrants correspondants pour chaque province et territoire. La répartition géographique est gardée constante durant toute la période de projection.

## Répartition des émigrants selon l'âge et le sexe

Pour effectuer la répartition des émigrants selon l'âge et le sexe, pour chaque province et territoire, une seule distribution est utilisée, soit une moyenne portant sur trois ans (1980-81, 1981-82 et 1982-83) et calculée d'après deux sources de données - le fichier des données fiscales de Revenu Canada et les données américaines de l'immigration en provenance du Canada<sup>(9)</sup>. La même répartition est gardée constante pour toute la durée de la période.

(9) Les chiffres de Revenu Canada ne donnent la répartition des migrants que par grand groupe d'âge. La répartition par simple année d'âge des émigrants a été effectuée à partir des données se rapportant aux immigrants canadiens vers les États-Unis. La répartition par âge obtenue des données de l'impôt est sans doute plus représentative de l'ensemble des émigrants que celle provenant des données américaines.

## INTERNAL MIGRATION PROJECTIONS

Internal migration is clearly the most unstable component of population change in Canada. In contrast to the relative smoothness of the mortality and even the fertility curves (where at least, cycles are longer and more regular) the fluctuations that occur in internal migration are abrupt, of large amplitude and frequently in the reverse direction. An analysis of the recent past very clearly reveals the instability of internal migration. For example, in 1980-81, when Alberta's economy was booming, the province posted very large net migration gains, about 44,000. There was no indication then that three years later it would show a net migration loss of some 43,000. Consequently, internal migration is the component that is least easy to predict; in fact, for many provinces it is the principal source of error in growth forecasts. The size of the migration flows and the uncertainty of future trends are such that in those provinces, which are heavily affected by migration, assumptions on migration are more critical than those on fertility.

It can be seen from Table 7 that inter-provincial migration plays a leading role in the population growth of the provinces.

TABLE 7. Natural Increase, Net International and Net Interprovincial Migration by Province and Territory, 1980-81

TABEAU 7. Accroissement naturel, migration internationale et migration interprovinciale dans les provinces et territoires, 1980-81

Province	Natural increase	Net inter-national migration	Net inter-provincial migration
	Accroissement naturel	Migration internationale nette	Migration interprovinciale nette
Newfoundland - Terre-Neuve	7,076	(1)	-3,552
Prince Edward Island - Île-du-Prince-Édouard	886	(1)	-1,251
Nova Scotia - Nouvelle-Écosse	5,134	(1)	-2,836
New Brunswick - Nouveau-Brunswick	5,455	146	-4,989
Québec	54,167	13,201	-22,841

## PROJECTION DE LA MIGRATION INTERNE

La migration interne est, de toute évidence, la composante la plus instable de la croissance démographique au Canada. Par rapport à la relative inertie qui caractérise la fécondité (du moins les cycles sont plus longs, plus réguliers et sans à coups) et la mortalité, la migration interne présente des fluctuations brusques, d'amplitude considérable et souvent en sens contraire. L'analyse du passé récent illustre très bien la nature instable du phénomène. En 1980-81 par exemple, l'Alberta, en plein essor économique, affichait des gains migratoires très élevés, de l'ordre de 44,000. Rien ne permettait alors de prévoir que trois ans plus tard, le bilan migratoire désignerait une perte nette du même ordre de grandeur, soit de 43,000. La migration interne est donc la composante qui se laisse le moins facilement prévoir; elle constitue d'ailleurs dans plusieurs provinces, la principale source d'erreur dans la prévision de l'accroissement de la population. L'ordre de grandeur des flux migratoires et l'incertitude quant à leur direction sont tels que dans certaines provinces ce sont les hypothèses de migration qui s'avèrent les plus cruciales.

Pourtant, la migration interne joue, dans l'évolution démographique des provinces, un rôle prépondérant, comme en témoignent les données du tableau 7.

In a number of provinces, out-migration offsets all or part of natural increase. This was particularly true of Prince Edward Island, New Brunswick and Manitoba in 1980-81. In Ontario and Quebec, the net losses through interprovincial migration cancelled out the gains due to international migration. In Alberta and British Columbia, the contribution of interprovincial migration to total growth was at least 55% higher than that of natural increase.

In the present situation of declining births and increasing deaths, the contribution of natural increase to population growth is bound to diminish, while that of migration could rise sharply. Thus, in view of the great uncertainty associated with future internal migration trends and their increasing influence on population growth, the degree of error in population forecasts is likely to increase at the subnational level.

### Projection Approach

The projection approach is based primarily on extrapolation of past trends. The analysis of the past covered a period of 17 years, from 1966-67 to 1983-84, with an emphasis on the trends observed in the second half of the 1970s and the early 1980s. In the recent past, two clearly defined migration patterns have been identified. The first, reflecting the westward population flow in response to the economic boom, chiefly to Alberta but also to British Columbia, occurred between 1973 and 1981. It was unlike anything that had happened in preceding years, as Alberta and British Columbia drew considerable numbers of in-migrants from all the other provinces. In fact, at one point, they were the only two provinces that posted large net migration gains. A reversal of this flow began in 1981, and since then, the internal migration picture has been completely different. There is currently a heavy outflow from Alberta and reduced gains in British Columbia. Almost all the other provinces are registering gains partly through return migration, whereas the two western-most provinces are sustaining either net migration losses or small gains. These trends are shown in Figure 3 which portrays the interprovincial net migration rates for the years 1961-62 to 1995-96. The volatile nature of past trends indicates that it is difficult to forecast with any accuracy how long the present cycle will last or even what its amplitude will be. The only thing that can be said with certainty is that, inherent in these migration patterns are economic forces that may persist - or change - in the next 10 or 15 years.

Dans plusieurs provinces, la migration interne vient souvent annuler en tout ou en partie l'apport de l'accroissement naturel. Cela s'est vérifié pour l'année 1980-81 à l'Île-du-Prince-Édouard, au Nouveau-Brunswick et au Manitoba. En Ontario et au Québec, le bilan interne négatif a pratiquement annulé les gains dus à la migration internationale. Par ailleurs, en Alberta et en Colombie-Britannique, l'apport de la migration interne a été de 55% supérieur à celui de l'accroissement naturel cette année-là.

Dans la conjoncture actuelle de baisse des naissances et de hausse des décès, la contribution de l'accroissement naturel est appelée à diminuer et celle de l'apport migratoire, à croître considérablement, augmentant d'autant le niveau d'incertitude des prévisions démographiques qui seront effectuées dans l'avenir, surtout au niveau provincial.

### L'approche choisie

L'approche choisie repose essentiellement sur une extrapolation des tendances. L'analyse du passé a porté sur une période de 17 années, soit de 1966-67 à 1983-84, principalement sur les tendances observées dans la seconde moitié des années 70 et au début des années 80. L'analyse a permis de mettre en évidence deux régimes migratoires. Le premier, qui reflète le mouvement migratoire vers l'Ouest pour répondre à l'essor économique surtout de l'Alberta mais aussi de la Colombie-Britannique, s'est produit entre 1973 et 1981. Il a représenté une situation totalement nouvelle par rapport aux années antérieures, l'Alberta et la Colombie-Britannique, les deux seules provinces d'ailleurs à afficher parfois une migration positive très élevée, attirant un nombre considérable de migrants en provenance de toutes les provinces. Un renversement de ce mouvement s'est amorcé vers 1981 et depuis, les migrations présentent une image complètement différente. On assiste actuellement à un mouvement élevé de sorties de l'Alberta et de la Colombie-Britannique. Presque toutes les provinces affichent des gains en partie constitués des migrations de retour, alors que les deux provinces les plus à l'Ouest ont une migration nette négative ou faiblement positive. Ce schéma est illustré à la figure 3 qui présente les taux de migration pour les années 1961-62 à 1995-96. Nous ne pouvons évidemment prédire avec exactitude combien de temps durera le cycle actuel ni même qu'elle sera son amplitude. Tout ce que nous pouvons avancer avec confiance toutefois, c'est qu'il existe derrière ces schémas de migration, des forces économiques qui ont des chances de persister - ou de se modifier - au cours des 10 ou 15 prochaines années.

Based on the analysis of past trends, the following three internal migration assumptions were developed.

### Assumptions

**Assumption A - Extrapolation of current trends.** This assumption reflects the possibility that current trends may continue for a few more years. In this assumption, Alberta and British Columbia experience either net migration losses or small gains and almost all the other provinces net migration gains. It is assumed that gradually, the heavy flows taper off and the losses and gains become less pronounced. This is the most likely scenario in the short term.

**Assumption B - Deviation from the current trends and gradual return to the 1974-1981 situation.** Assumption B is based on the possibility that the economic boom in the West (mainly an oil boom) will recur and that migrant population will gradually resume flowing to Alberta and British Columbia, as it did between 1974 and 1981. Thus, it is intended to reflect a situation in which these two provinces would draw large numbers of migrants from the other provinces once again by the end of this decade. However, this movement is assumed to be less pronounced than the one in 1974-1981, since the latter was accompanied by a particularly deep recession in Ontario, the province of origin of many migrants and the traditional province of attraction. This scenario is most "favourable" to the growth of Alberta and British Columbia and least "favourable" to all the other provinces.

**Assumption C - A situation midway between the above two extremes.** Since Assumptions A and B reflect opposite migration patterns with a fairly wide range, it was decided to offer a middle option in which internal migration would fall somewhere between the two extremes outlined above. This scenario is obtained by taking the arithmetic average of the migration rates for the two years in which the trend reversal took place, 1981-82 and 1982-83. It is a medium assumption for all the provinces, except Manitoba.

The levels of net migration generated on the basis of these three assumptions are shown in Table 8. These are portrayed in the form of rates in Figure 3.

Sur la base de l'analyse des tendances du passé, nous avons défini les trois hypothèses de migration interne suivantes.

### Hypothèses

**Scénario A - Extrapolation des tendances actuelles.** Ce scénario reflète la possibilité que les mouvements récents se prolongent encore quelques années. Il représente un bilan négatif ou faiblement positif pour l'Alberta et la Colombie-Britannique et un solde positif pour presque toutes les autres provinces. Graduellement, les valeurs très fortes s'atténuent, pertes et gains devenant moins prononcés avec le temps. C'est, à court terme, le scénario le plus plausible.

**Scénario B - Rupture de la tendance récente avec retour graduel vers la situation observée en 1974-1981.** Ce scénario est lié à la possibilité d'une reprise éventuelle de l'essor économique de l'Ouest - essor lié à l'industrie pétrolière - et donc d'un retour graduel du mouvement migratoire vers l'Alberta et la Colombie-Britannique observé entre 1974 et 1981. Il vise donc à refléter une situation en vertu de laquelle ces deux provinces de l'Ouest attireraient à nouveau un nombre considérable de migrants en provenance de toutes les provinces. Le mouvement cependant est moins prononcé que celui de 1974-1981 puisque ce dernier s'est accompagné comme on le sait, d'une récession particulièrement forte en Ontario, province d'attraction traditionnelle et source importante de migrants. C'est le scénario le plus favorable à la croissance de l'Alberta et de la Colombie-Britannique, mais le moins favorable pour toutes les autres provinces.

**Scénario C - Scénario à mi-chemin entre les deux situations extrêmes ci-dessus.** Comme les scénarios A et B ci-dessus reflètent des régimes migratoires opposés et définissent un éventail souvent très large, nous avons choisi d'offrir une option moyenne selon laquelle les migrations se situeraient quelque part entre les valeurs extrêmes définies par les scénarios A et B ci-dessus. Ce scénario est obtenu en faisant la moyenne arithmétique des taux de migration portant sur les deux années où s'est observé le renversement des tendances, soit 1981-82 et 1982-83. C'est une hypothèse moyenne pour toutes les provinces à l'exception du Manitoba.

La migration nette engendrée par ces trois scénarios est présentée au tableau 8 et illustrée sous forme de taux à la figure 3.

## Data Sources and Projection Method

The data used for the analysis of past trends and for the projections are migration estimates based on two administrative data files - the income tax and family allowance files. For the period 1966 to 1981, estimates of migration flows based on income tax files were used. For the most recent years, 1981-82, 1982-83 and 1983-84 (part of the year), migration estimates based on family allowance records were used.

For the first time, projections were developed by extrapolating migration rates by origin and destination for each region. The projection was carried out in two stages. First, total out-migration rates were extrapolated for each area. Then, proportional distributions of in-migrants were extrapolated for each area of destination. A regression method was used to simulate various migration patterns. By changing the parameters, several migration patterns were generated. The migration rates thus obtained were submitted to provincial representatives for their comments. Their suggestions on the most likely trends for their respective provinces were helpful in the process of adjusting and finalizing the selection of alternative migration rates for the projections. The rates were then applied to the population of each area to produce numbers of in- and out-migrants for each projected year. This is illustrated by the following equations.

1. Calculation of the total number of out-migrants  $M_i$  for each area:

$$M_i = m_i \times P_i \quad (1)$$

where  $P_i$  = population of origin  $i$ ; and

$m_i$  = annual out-migration rates for area  $i$ .

2. Distribution of out-migrants from each area of origin by area of destination (on the basis of in-migration proportions):

$$M_{ij} = M_i \times P_{ij} \quad (2)$$

where  $M_{ij}$  = number of persons moving from area  $i$  to area  $j$  (origin-destination flows);

$M_i$  = number of out-migrants from area  $i$ ; and

$P_{ij}$  = origin-destination proportions.

In the third stage, the migrants for each area were distributed by age and sex, using an approach based on age-specific migration rates, thus relating propensity to move to the population at risk.

## Sources de données et méthode de projection

Les données utilisées pour l'analyse du passé et l'extrapolation proviennent de deux fichiers administratifs, soit celui de l'impôt et celui des allocations familiales. Pour les années 1966 à 1981, l'estimation des flux migratoires provenant du fichier de l'impôt a été utilisée. L'estimation provenant du fichier des allocations familiales pour sa part nous a fourni les données les plus récentes, soit pour 1981-82, 1982-83 et 1983-84 (une partie de l'année).

La méthode a consisté à extrapoler les taux de migration selon l'origine et la destination pour chacune des régions. La projection s'est effectuée en deux temps. Dans un premier temps, le taux de sortie global de chaque région a fait l'objet d'une extrapolation suivie, dans un deuxième temps, de l'extrapolation de la répartition des migrants par région de destination. Une analyse de régression a permis de simuler divers schémas de migration. En agissant sur les paramètres, on a pu ainsi générer plusieurs variantes ou hypothèses de taux de migration. Les taux ainsi obtenus ont été soumis à l'attention des représentants des gouvernements provinciaux et leurs suggestions prises en considération dans toute la mesure du possible lors du choix final d'hypothèses. Ces taux ont servi de données d'entrée pour la projection. Il s'agissait ensuite d'appliquer ces taux à la population de chacune des régions afin d'obtenir les effectifs projetés d'entrants et de sortants. Les équations suivantes illustrent cette approche.

1. Calcul du nombre total de sortants  $M_i$  pour chaque région:

où  $P_i$  = population d'origine  $i$ ; et

$m_i$  = taux de sortie annuels pour chaque région d'origine  $i$ .

2. Répartition des sortants de chaque région d'origine par région de destination (sur la base d'un ensemble de proportions d'entrée):

où  $M_{ij}$  = sortants de la région  $i$  allant vers la destination  $j$ ; (i.e., les flux origine-destination)

$M_i$  = sortants de chaque région  $i$ ; et

$P_{ij}$  = les proportions origine-destination.

Une troisième étape nous a permis de décomposer par âge et sexe les migrants de chaque région, à partir d'une approche basée sur les taux de migration par âge, liant ainsi la propension à migrer à la population soumise au risque.

## CHOICE OF PROJECTION SERIES

A total of 18 projections were developed using all possible combinations of the three fertility, the two international migration and the three internal migration assumptions. From these, five projection series were selected for publication purposes. The selection was made on the basis of a variety of considerations, the primary one being the need for a combination of assumptions that would reflect a continuation of current trends. With this objective, a scenario which incorporates the most plausible course of events in the short term (Projection 1 in Table 9), was first selected. The other scenarios are intended to reflect possible deviations from current trends. They were selected to provide a plausible range of growth possibilities in each province and for Canada as a whole. In addition, the views of several experts, including the provincial focal points were also considered in the final selection of the five projection series.

## CHOIX DES SCÉNARIOS DE PROJECTION

En combinant entre elles les trois hypothèses de fécondité, les deux hypothèses de migration internationale et les trois scénarios de migration interne, on obtient un ensemble de 18 projections. Parmi ces 18 projections, nous avons dû faire choix d'un sous-ensemble approprié en vue de la publication. Pour faire ce choix, nous nous sommes laissés guider par diverses considérations dont la première a consisté à choisir une combinaison d'hypothèses qui illustrerait la poursuite des tendances observées récemment. On a été ainsi amené à définir un scénario qui, à court terme, correspond à l'évolution la plus plausible (projection 1 du tableau 9). Les autres scénarios retenus représentent des ruptures par rapport aux tendances récentes. Ils ont été choisis de façon à offrir un éventail plausible des possibilités de croissance dans chaque province et pour le Canada pris globalement. Une ronde de consultations auprès de plusieurs experts, dont les agences statistiques de chaque province, nous a en outre permis de cerner les points de vue respectifs des représentants provinciaux que nous avons essayé de prendre en compte dans la mesure du possible.

TABLE 9. Summary of Component Assumptions Underlying the Five Projections

TABLEAU 9. Les cinq projections retenues et leurs hypothèses

Projection series number	Fertility (number of children per woman by 1996)	International migration (net gain per year)	Internal migration pattern
Numéro de la projection	Fécondité (nombre d'enfants par femme en 1996)	Migration internationale (gain net par année)	Migration interne
thousands - milliers			
1	1.40	50	(A)
2	1.40	50	(B)
3	1.66	50	(B)
4	1.66	100	(A)
5	2.20	100	(C)

(A) Continuation of current trends; (B) Gradual return to westward flow; (C) Recent rates (average for 1981 to 1983) remain constant for the projection period.

(A) Poursuite des tendances récentes; (B) Retour graduel du mouvement vers l'ouest; (C) Taux actuels (moyenne des taux de 1981 à 1983) maintenus constants pour toute la période de projection.

**Source:** Derived from tables in the text.

**Source:** Provenant des tableaux du texte.

**Note:** (1) Projection 1 is the low-growth scenario; the other projection series represent possible shifts in the trends for one or more components. (2) The mortality assumption is the same for all the projection series (see text).

**Nota:** (1) La projection 1 est le scénario de croissance faible; les autres projections représentent des changements possibles qui pourraient survenir dans l'évolution des composantes.

(2) L'hypothèse de mortalité est la même pour toutes les projections (voir le texte).

The five projections chosen are summarized in Table 9.

At the **national level**, Projections 1 and 2 are low-growth scenarios and yield identical results. Projections 3 and 4 are medium-growth scenarios, and Projection 5, which is built on the assumption of a complete reversal in fertility and international migration trends, yields a much higher growth than the others.

At the **provincial level**, the choice of projection series is much more complex, primarily because of the additional assumptions on internal migration. As interprovincial net migration is zero at the national level, migration gains by one province are losses incurred by other provinces. It is therefore difficult to suggest a series which offers a "high" or a "low" growth for all the provinces together.

Table 10 shows the population reached by 2006 and the ranking of the series for each province.

Les cinq projections retenues sont résumées au tableau 9.

Au **niveau national**, les projections 1 et 2 représentent des scénarios de croissance faible et donnent des résultats identiques. Les projections 3 et 4 constituent des scénarios de croissance moyenne, alors que la projection 5, qui sous-tend un renversement radical des tendances de la fécondité et de la migration internationale, engendre une croissance très forte par rapport aux autres.

Au **niveau provincial**, la situation est beaucoup plus complexe à cause notamment de l'introduction d'hypothèses portant sur la migration interne. La migration interprovinciale nette étant égale à zéro au niveau national, il s'ensuit que les gains d'une province doivent nécessairement correspondre à des bilans négatifs pour les autres. On ne peut donc identifier une projection qui offre un scénario de croissance "forte" ou "faible" et ce, pour toutes les provinces à la fois.

Le tableau 10 donne pour chaque province, la population atteinte en 2006 dans chacun des scénarios et le classement des projections par ordre décroissant.

TABLE 10. Population Reached by 2006 and Ranking of Series from Highest to Lowest, Canada, Provinces and Territories

## PROJECTION RESULTS

### Introduction

In order to illustrate the projections results, a scenario approach has been adopted, that is, of the five projection series selected for publication, three were chosen to illustrate the future growth and structure of Canada's population. These three projections represent a combination of assumptions which circumscribe three growth scenarios: "high growth", "medium growth" and "low growth." The assumptions underlying these growth scenarios are specified in Table 9. At the national level, the high scenario assumes high fertility (2.2 children per woman) and high net international migration (100,000 per year); the medium scenario assumes constant fertility (1.66 children per woman) and low net international migration (50,000 per year) unless otherwise indicated; and the low scenario assumes low fertility (1.4 children per woman) and low net international migration. Mortality assumption is the same in all the scenarios: life expectancy at birth increases to 74.9 years for males and 81.6 years for females by 1996.

As to the time horizon of the projection, it varies depending on the level of aggregation. For the provinces, results cover a period of 25 years. At the national level they are extended to 2031. It is only then that the last baby-boom cohorts will have reached 65; only by following these cohorts through retirement age does the study of aging reach its full dimension.

### National Population Size and Growth

The major trends which emerge in the projections of Canada's population (under the low-growth scenario) over the next few decades are as follows: (i) a slowdown in growth, probably to almost zero by 2006, followed by population decline a few years later; (ii) confirmation of the aging process that started a few years ago; and (iii) little change in the overall distribution of population among the provinces and territories.

Canada's total population will continue to increase until the turn of the century, but probably at a slower pace. It reached the 25 million mark at the end of 1983 and is likely to reach some 28 million by 2006. A few years later, the size of the population would begin to decline so that by 2031, the Canadian population would probably have returned to its 1992 level of approximately 27 million (Table 11).

## PRÉSENTATION DES RÉSULTATS

### Introduction

Pour présenter les résultats des projections, nous avons adopté l'approche par scénario: parmi les cinq projections retenues, nous avons fait choix d'un sous-ensemble de trois que nous employons pour illustrer la croissance et la structure éventuelles de la population du Canada. Ces trois projections délimitent trois types de croissance, forte, moyenne et faible. Les hypothèses sous-jacentes à ces scénarios sont présentées au tableau 9. Le scénario de croissance forte résulte, au plan national, de la combinaison d'une hypothèse de reprise de la fécondité (2.2 enfants par femme) et d'une immigration nette élevée (100,000 par an); le scénario de croissance moyenne combine une hypothèse de fécondité constante (1.66 enfant par femme) et une migration nette faible (50,000 par an, sauf indication contraire); pour sa part, le scénario de croissance faible combine une hypothèse de fécondité faible (1.4 enfant par femme) et un niveau d'immigration nette faible. Quant à l'hypothèse de mortalité, elle est la même dans tous les scénarios: l'espérance de vie à la naissance augmente pour atteindre en 1996, 74.9 ans chez les hommes et 81.6 ans chez les femmes.

La période retenue pour l'analyse des résultats est de 25 ans pour les effectifs provinciaux. Les résultats au niveau national sont illustrés jusqu'en 2031. Ce n'est qu'en 2031 en effet que l'arrière-garde des cohortes du baby-boom atteindra 65 ans; l'étude du vieillissement démographique ne prend toute sa signification qu'avec la prise en compte de ces cohortes jusqu'à l'âge de la retraite.

### Croissance de la population canadienne

Les grandes tendances qui se dégagent de l'évolution démographique canadienne prévue selon le scénario de croissance faible au cours des prochaines décennies sont les suivantes: (i) ralentissement de la croissance; une croissance presque nulle est possible vers 2006, suivie d'un déclin quelques années plus tard; (ii) confirmation du vieillissement de la population amorcé il y a déjà quelques années; et (iii) peu de changement dans la répartition de la population dans les provinces et territoires.

La population totale du pays continuera de croître jusqu'au tournant du siècle, quoique de plus en plus lentement. Elle était de 25 millions à la fin de 1983; elle atteindra vraisemblablement les 28 millions au tournant du siècle dans l'hypothèse d'une poursuite des tendances. Puis, s'amorcerait quelques années plus tard un déclin, la population diminuant en valeur absolue. En 2031, les effectifs seraient revenus à leur niveau de 1992, près de 27 millions (tableau 11).

Sources: 1971-1983: Statistique Canada, Estimations annuelles postcensitaires de la population suivant l'état matrimonial, l'âge, le sexe et les composantes de l'accroissement, Canada et provinces au 1<sup>er</sup> juin 1982 et 1983, vol. 1, n<sup>o</sup> 91-210 au catalogue, annuel, 1984; 1984-2031: tableaux détaillés, partie II.

If, however, the trends should shift with a sharp upturn in fertility and a doubling of net migration, Canada's population would reach 32 million in 2006 and 38 million by 2031 (Figure 4). Nonetheless, it is quite possible that Canada's population will not double again. It took 36 years to grow from 12.5 million to the current 25 million, and unless a drastic change in the components of growth occurs, it is unlikely that the population would ever reach 50 million.<sup>(10)</sup> Under the assumption that present trends will prevail, the number of births continues to fall while the number of deaths continues to rise. As a result, natural increase - the excess of births over deaths - shrinks to zero somewhere around 2004 (Table 12 and Figure 5).

(10) A quick extrapolation of the trends underlying the high-growth scenario over 100 years reveals that even if fertility and migration trends shifted, the population would take more than a century to double.

En cas de rupture des tendances, à savoir une brusque remontée de la fécondité et un doublement de la migration internationale, la population du Canada atteindrait 32 millions vers 2006, puis 38 millions en 2031 (figure 4). Il est très possible que la population du Canada ne double jamais plus; nous avons mis 36 ans pour passer de 12.5 à 25 millions mais, à moins d'une rupture radicale avec les tendances actuelles, nous n'atteindrons sans doute jamais les 50 millions<sup>(10)</sup>. Dans l'hypothèse d'un prolongement des tendances récentes, le nombre des naissances diminue continuellement alors que celui des décès augmente régulièrement. Par conséquent, l'accroissement naturel, c.à.d., l'excédent des naissances sur les décès, devient nul vers 2004. C'est vers cette année-là que le nombre des décès rejoindrait celui des naissances (tableau 12 et figure 5).

(10) Une rapide extrapolation sur 100 années des tendances illustrées dans le scénario de croissance forte révèle que même en cas de rupture des tendances, le doublement prendrait plus d'un siècle à se réaliser.

Source: Detailed Tables, Part II. - Tableaux détaillés, partie II.

Population growth could continue for a somewhat longer interval beyond 2004 if there were net migration gains, but this would only postpone the decline by a few years. The detailed tables show that population decline begins in about 2013 if fertility continues to fall and net migration remains at the low levels seen in recent years, while it would be postponed to about 2019, if net migration doubled to 100,000 per year. On the other hand, if fertility stays at its present level and net immigration doubles, the decline would be delayed by another 10 to 15 years.

An extremely important consequence of a continuation of the current low fertility is the role immigration may have in the future growth of the country. In the present context of a low fertility and possible negative natural increase early in the next century, immigration will become the major factor of growth. An assumed net migration of 50,000 per year generates roughly an additional 1.2 million people to Canada's population over a 25-year period and 2.6 million over a 50-year period. If net migration were to double to 100,000 per year, the population size in 2031 would reach 29.6 million, compared to 26.8 million under the low migration assumption. Thus, although the population eventually declines under the low and constant fertility assumptions, the impact of net immigration would be to postpone the decline by a few years (Table 13).

La population pourtant continuerait d'augmenter encore quelques années du fait d'une migration nette positive. Mais l'apport migratoire ne fait que retarder de quelques années le déclin: celui-ci s'amorcerait vers 2013 si la fécondité continuait de baisser et si la migration nette se maintenait au faible niveau des dernières années, quelques années plus tard, vers 2019, dans l'hypothèse d'un doublement du solde migratoire (100,000 par an). Si par ailleurs, la fécondité se stabilisait à son niveau actuel et si la migration doublait, le déclin de la population canadienne serait reporté d'au moins une décennie.

Une conséquence extrêmement importante de la poursuite de la faible fécondité actuelle est le rôle que l'immigration est appelée à jouer dans la croissance démographique future du pays. Dans la conjoncture actuelle de faible fécondité et d'un accroissement naturel qui pourrait devenir négatif à l'aube du 21<sup>e</sup> siècle, l'immigration deviendra la source principale d'accroissement démographique au Canada. L'hypothèse d'un apport migratoire de 50,000 par an ajoute grosso modo 1.2 million de plus à la population canadienne sur une période de 25 années, 2.6 millions sur une période de 50 années. Si l'immigration nette devait doubler, la population, en 2031, atteindrait 29.6 millions, contre 26.8 millions seulement, dans l'hypothèse faible de migration. Même si dans les deux cas la population décline éventuellement à cause d'une fécondité en baisse, l'immigration permet de reporter l'échéance de quelques années (tableau 13).

### Changes in the Age Structure

The aging trend in Canada's population, already evident in the current demographic structure, is confirmed and becomes even more pronounced in most of the scenarios. The direct cause of this trend is the well-known decline in fertility to a subreplacement level, which appeared in the early 1970s.

The young and elderly age groups are moving in opposite directions: at one end of the age spectrum, the population is shrinking, while at the other end, it is growing rapidly. In the 1981 Census, young people (age 0-17) made up 28% of Canada's population, and elderly people 10%. By 2006, these percentages would be much closer if a low fertility were to predominate: young people would account for no more than 19% of the population, and elderly people for about 15%. The proportions converge at roughly 17% somewhere around 2012, and if the trend continues, elderly people reach an astonishing 27% of the population by 2031, compared with only 15% for young people. Under the high fertility assumption, the proportion of elderly still increases significantly, although not as much as in the low fertility assumption; it reaches 13% by 2006 and 19% by 2031, that is, almost twice as much as the current level (Table 14).

### Modifications de la structure par âge

La tendance au vieillissement de la population canadienne, déjà inscrite dans l'évolution actuelle, se confirme et même s'accroît dans la plupart des scénarios retenus. L'avènement, au début des années 70, d'un niveau de fécondité qui n'assure plus le remplacement des générations, est la cause directe du vieillissement.

Un mouvement opposé caractérise l'évolution des jeunes et des personnes âgées: diminution des jeunes en nombre absolu à une extrémité de l'échelle des âges, alors qu'à l'autre extrémité, on observe une rapide expansion du nombre des personnes âgées. Au recensement de 1981, les jeunes de 0-17 ans représentaient 28% de la population canadienne et les personnes âgées, 10%. En 2006, si les tendances actuelles de fécondité devaient se poursuivre, leurs parts relatives se rapprocheraient l'une de l'autre: les jeunes ne représenteraient plus que 19% de la population alors que la proportion des personnes âgées serait de l'ordre de 15%. Vers 2012, phénomène intéressant, leur proportion est identique, soit 17%. Puis, si la tendance se poursuit, en 2031, les personnes âgées atteindraient 27% de la population totale et les jeunes, 15% seulement. Dans l'hypothèse de remontée de la fécondité, la proportion des plus de 65 ans augmente aussi de façon substantielle, bien que moins rapidement elle atteint 13% en 2006 et 19% en 2031, soit le double de son niveau actuel (tableau 14).

Changes in the age structure, as illustrated by the projections, suggest that Canadian society will be substantially different from what it is today. If the assumptions underlying the low-growth projection hold good, the median age of the population will rise from 30 years in 1983 to 41 years in 2006 and reach 48 years by 2031. The reason for the dramatic increase in median age during the projection period is evident in the population pyramids for 1981, 2006 and 2031 presented in Figure 6.

Les modifications de la structure par âge illustrées par les projections et déjà inscrites dans la conjoncture actuelle, laissent donc entrevoir une société passablement différente de celle que l'on connaît aujourd'hui. Si l'hypothèse de prolongement des tendances se confirme, l'âge médian de la population pourrait atteindre 41 ans en 2006 et 48 ans en 2031, contre 30 ans présentement. L'inversion de la pyramide des âges, représentée à la figure 6, pour les années 1981, 2006 et 2031, illustre de façon dramatique les bouleversements structurels dont s'accompa-

Figure 6

Population by Age and Sex, Canada, 1981 (Census), 2006 and 2031 (Projection 1)

Population selon l'âge et le sexe, Canada, 1981 (recensement), 2006 et 2031 (Projection 1)

The drastic changes in the shape of the age pyramid over the years from being relatively bottom heavy to being top heavy indicate the evolution of the aging process of the population as a result of a long-term decline in fertility level. This implies, for example, that for every 100 electors in 2006, 18 would be over 65 while in 2031, 31 would be over 65 against 14% currently. Among the elderly population, the numerical imbalance between the sexes is expected to remain quite large: for every 100 women over 65, there would be only 76 men in 2006. Which-ever scenario is considered, the aging process seems to be an inevitable part of the future of Canada's population at least in the short and medium term. Every facet of society will be affected - consumption, savings and investment, leisure, housing and social programmes, to name only a few of the most obvious impact areas.

#### Pre-school and School-age Population, Age 0-17

As indicated earlier, the number of young people aged 0-17 has been declining. There were 6.7 million of them in 1983; by 2006, if current low fertility level prevails, there would be about 5.2 million, and in 2031 there may be a mere 4.0 million (Table 15). However, the projections for this age group are the most uncertain: history has already shown that fertility cycles can occur and that the amplitude of these cycles is almost impossible to predict. The post-war baby-boom and the sharp drop in the 1960s are clear evidence of this.

gnera le vieillissement de la population. Sur 100 électeurs, 18 auraient plus de 65 ans en 2006 et 31 en 2031, contre 14% présentement. Aux âges avancés, le déséquilibre numérique entre les sexes reste considérable: chez les plus de 65 ans, pour 100 femmes, on ne compterait que 76 hommes. Quel que soit le scénario envisagé, le vieillissement de la population semble bel et bien inscrit dans le devenir de la population canadienne du moins à court et à moyen terme. Tous les secteurs de l'activité sociale en seront modifiés, la consommation, l'épargne et l'investissement, les loisirs, les modes d'habitation et les programmes sociaux pour n'en nommer que quelques-uns, parmi les plus évidents.

#### Les jeunes d'âge scolaire et préscolaire: les 0-17 ans

C'est un fait bien connu que le nombre de jeunes diminue. En 1983, on en comptait 6.7 millions, en 2006, on en retrouverait quelque 5.2 millions dans l'hypothèse d'une fécondité en baisse et en 2031, leur nombre pourrait n'être plus que de 4.0 millions (tableau 15). C'est dans ce groupe d'âge cependant que les projections présentent la plus grande incertitude. L'histoire a déjà prouvé que des cycles de fécondité peuvent exister et que l'amplitude de leurs fluctuations est presque impossible à anticiper. On se rappelle le baby-boom d'après-guerre et la chute rapide des années soixante.

Source: Detailed Tables, Part II. - Tableaux détaillés, partie II.

Depending on whether fertility continues to decline, remains stable, or rises sharply, the number of young people will vary substantially. In 2006, the population aged 0-17 will probably be smaller, somewhere between 5.2 and 6.2 million depending on whether fertility keeps decreasing or levels off. Projecting the trend even further, we find that the number of young people continues to fall, reaching between 4.0 and 5.5 million by 2031. On the other hand, if the trends shift abruptly and fertility rebounds, there may be 8.0 million young people in 2006 and more than 9 million by 2031 (Table 15).

Thus, the assumptions of decreasing and constant fertility yield a decline in the number of young people, while the high-fertility assumption points to an increase. Under the first two assumptions, the proportion of young people in the total population falls, while in the third, it hovers around 25%.

#### Pre-school Population, Age 0-4

The evolution of the young child population aged 0-4 is closely linked with the trend in fertility. If fertility continues falling for another few years, the very slight increase in the number of children aged 0-4 expected between now and 1986, would thereafter be followed by a rather steep decline. The population aged 0-4 is currently estimated (in 1983) at 1.8 million; by 2006, it may be no more than 1.3 million. By 2031 their number may even have shrunk to less than 1 million (Figure 7). If, on the other hand, fertility stabilizes at its present level and immigration increases, the under five population will rise until about 1990, when it will be roughly 1.9 million, an all-time high under the constant fertility assumption. Fifteen years later, in 2006, it will have dropped to about 1.7 million, and as the decline continues, it will further decrease to 1.6 million by 2031.

If there were to be a sudden upswing in fertility coupled with a doubling of net migration, the resulting increase in births could push the under five population up to 2.2 million by 2006 and 2.6 million by 2031.

#### Elementary School Population, Age 5-13

Under the declining fertility assumption, the number of children in the 5-13 age group will oscillate between 3.2 and 3.3 million until 1996. Then it will drop rapidly to

Selon que la fécondité continue de baisser ou reste stable ou encore remonte brusquement, l'effectif des jeunes varie considérablement. En 2006, le nombre de jeunes de 0-17 ans aura sans doute baissé: on en comptera entre 5.2 et 6.2 millions selon que la fécondité continue de baisser ou se stabilise. Dans une perspective à plus long terme, le nombre de jeunes continue de diminuer et, en 2031, leur effectif se situerait entre 4.0 et 5.5 millions. Par contre, en cas de rupture brusque des tendances, à savoir une remontée de la fécondité, on pourrait en compter 8.0 millions en 2006 et plus de 9 millions en 2031 (tableau 15).

Il y aurait donc décroissance du nombre des jeunes dans les hypothèses de fécondité à la baisse et de fécondité constante et croissance dans l'hypothèse forte. En termes de proportions, leur part relative diminue dans toutes les hypothèses, sauf dans l'hypothèse d'une brusque remontée de la fécondité, où les proportions fluctuent autour de 25%.

#### Les jeunes d'âge préscolaire, les 0-4 ans

L'évolution de l'effectif des jeunes d'âge préscolaire (les 0-4 ans) est liée étroitement à celle de la fécondité. Si celle-ci devait poursuivre son mouvement à la baisse encore quelques années, on observerait d'ici 1986, une très faible augmentation des enfants âgés de 0-4 ans, suivie après 1986, d'une baisse assez spectaculaire. On estime présentement à 1.8 million le nombre des 0-4 ans. En 2006, les jeunes d'âge préscolaire ne seraient plus que 1.3 million et, dans une perspective à plus long terme, en 2031, l'effectif serait de moins d'un million (figure 7). Par contre, si la fécondité devait se stabiliser à son niveau actuel et l'immigration augmenter, le nombre d'enfants âgés de 0-4 ans augmenterait jusque vers 1990. Cette année-là, l'effectif pourrait se situer à près de 1.9 million, valeur maximale dans l'hypothèse de fécondité constante. Quinze ans plus tard, en 2006, l'effectif des jeunes d'âge préscolaire aurait diminué à 1.7 million environ. Puis la baisse se poursuivant, il ne serait plus que de 1.6 million vers 2031.

Evidemment, si l'hypothèse d'une remontée soudaine de la fécondité associée à un doublement de l'immigration devait se réaliser, l'effectif des moins de cinq ans, suivant en cela l'augmentation du nombre de naissances qui en résulterait, pourrait atteindre 2.2 millions en 2006 puis 2.6 millions en 2031.

#### Les jeunes du secteur scolaire élémentaire, les 5-13 ans

Dans l'hypothèse d'une poursuite de la baisse de la fécondité, le nombre des jeunes de 5-13 ans fluctue entre 3.2 et 3.3 millions jusqu'en 1996. Puis, l'effectif diminue rapidement: en 2006, il

only 2.6 million in 2006 and 2 million in 2031. Under the constant fertility assumption combined with a doubling of net migration, the population of this group will fluctuate between 3.2 and 3.5 million throughout the projection period. Under the rising fertility assumption, however, it rises steadily to slightly over 4 million in 2006 and almost 5 million in 2031 (Figure 7).

#### Secondary School Population, Age 14-17

Over the next 10 years, the number of people in the 14-17 age group is expected to decrease rapidly; in 1991, there may be only 1.4 million, a drop of 327,000 in 10 years. In 2006, the population will be between 1.4 and 1.5 million, depending on whether a declining or a constant fertility takes place. If we look further into the future, the size of this group could decrease to somewhere between 1 and 1.5 million by 2031.

n'est plus que de 2.6 millions et tombe à 2 millions seulement en 2031. Dans l'hypothèse d'une stabilisation de la fécondité, l'effectif pourrait fluctuer entre 3.2 et 3.5 millions tout au long de la période de projection. Par contre, dans l'hypothèse d'une reprise de la fécondité, l'effectif des 5-13 ans augmenterait régulièrement pour atteindre un peu plus de 4 millions en 2006 et près de 5 millions en 2031 (figure 7).

#### Les adolescents du niveau secondaire, les 14-17 ans

Au cours des 10 prochaines années, le nombre des adolescents âgés de 14-17 ans diminuera à un rythme très rapide; en 1991, on n'en comptera plus que 1.4 million, une baisse de quelque 327,000 en 10 ans. En 2006, l'effectif se situerait entre 1.4 et 1.5 million, selon que l'on retient l'hypothèse de baisse ou de stabilisation de la fécondité. Dans une perspective à long terme, vers 2031, le nombre des jeunes de 14-17 ans pourrait varier entre 1 et 1.5 million.

The assumption of an upturn in fertility, however, produces an increase in this group

Seule, toutefois, l'hypothèse d'une remontée de la fécondité engendre une augmentation de cet

after 1991. Under this assumption, the population returns to its present level of 1.6 million by 2001 and by 2031, it could be about 2 million (Figure 7).

### Young Adults, Age 18-24

The young adult group is especially important because of its pivotal position in the life cycle. It is during this period (ages 18-24) that most people enter the labour market; this group also has the highest rate of unemployment. People of this group consider getting married and starting a family. They also have voting rights, and a growing percentage of them attends college or university.

The young adult population probably reached an all-time high of 3.3 million in 1983. It will decrease steadily as the years pass, reaching about 2.6 million in 2006 under all scenarios. Up to that time, the figures can be projected with some confidence because most of the age group's members have already been born. After 2006, uncertainty starts to mount. By 2031, the population will be between 1.9 and 2.3 million, according to the low- and medium-growth scenarios. If fertility increases and net migration doubles, however, the young adult population would be slightly above its 1983 level in 2031, at 3.4 million. The proportion of young adults in the total population is likely to decline, under all scenarios except for the first 15 years of the next century, when it remains more or less stable and may reach 7% to 9% by 2031 (Table 16).

effectif au-delà de 1991; selon cette hypothèse, il aurait retrouvé vers 2001, son niveau actuel de 1.6 million; en 2031, le nombre des jeunes de 14-17 ans serait de l'ordre de 2 millions dans cette hypothèse de croissance rapide (figure 7).

### Les jeunes adultes, les 18-24 ans

Le groupe des jeunes adultes présente une importance cruciale ne fut-ce que par la position stratégique qu'il occupe dans le cycle de vie. C'est lorsqu'ils atteignent 18-24 ans en effet que les jeunes entrent sur le marché du travail; on y retrouve également le plus fort taux de chômage. À cet âge, on pense à fonder un ménage, à se marier, on commence à voter. Une proportion croissante se retrouve au collège ou à l'université.

Cet effectif a probablement atteint sa valeur maximale: on en comptait 3.3 millions en 1983. L'effectif diminue régulièrement dans le temps. On en comptera quelque 2.6 millions en 2006, quel que soit le scénario considéré. Jusqu'à ce moment-là, la population des 18-24 ans peut être prévue avec une assez bonne assurance puisque ces jeunes sont dans une large majorité déjà nés. Au-delà de 2006, l'incertitude augmente et selon les scénarios de croissance faible et moyenne, on en compte entre 1.9 et 2.3 millions en 2031. Par contre dans l'hypothèse d'une remontée de la fécondité et d'un doublement de l'immigration, l'effectif des jeunes adultes aurait en 2031 retrouvé et même légèrement dépassé le nombre observé en 1983, 3.4 millions. Leur proportion diminue également dans tous les scénarios, sauf durant une courte période au début du siècle; les jeunes adultes ne représentent plus que 7% de la population totale en 2031, 9% dans l'hypothèse de croissance forte (tableau 16).

## The Population Aged 18-64

The growth of the population aged 18-64, which mostly constitutes the labour force can be predicted with fairly good confidence up to the turn of the century as this population is already born. In 2006, there will be almost 19 million Canadians between the ages of 18 and 64, nearly 3 million more than in 1983. The population of this group may remain fairly stable for a few years, and then enters a period of decline during which it could shrink to a level not far from its present level by 2031 (Table 17). Only the high-growth scenario generates a continuous growth of this group throughout the projection period.

## La population des 18-64 ans

On peut, jusqu'à la fin du siècle, prévoir à peu de chose près l'évolution de l'effectif des adultes puisqu'ils sont déjà nés. En 2006, la population canadienne comptera près de 19 millions de personnes âgées de 18 à 64 ans, un accroissement de presque 3 millions sur l'effectif de 1983. Leur nombre pourrait demeurer à peu près stable durant quelques années puis amorcer un déclin qui le mènerait, en 2031, à un niveau pas très éloigné de son niveau actuel (tableau 17). Seul le scénario de croissance forte engendre une augmentation continue de la population adulte jusqu'à la fin de la période de projection.

TABLE 17. Projected Population Aged 18-64 According to Three Growth Scenarios, Canada, Selected Years 1981 to 2031

Source: Detailed Tables, Part II.

Source: Tableaux détaillés, partie II.

The 18-64 age group made up 63% of Canada's total population in 1983; by 2006, it may account for over two-thirds of the population. This means that between now and roughly 2006, Canada may have the largest labour force population in its history. The next 30 years could be a period of demographic advantage, so to speak, since the

La population des 18-64 ans représente actuellement 63% de la population totale; en 2006, elle pourrait représenter plus des deux tiers de la population. C'est donc dire que d'ici 2006 environ, la population canadienne pourrait compter vraisemblablement le plus fort contingent d'adultes de son histoire. Les quelque 30 prochaines années constitueraient en quelque

financial burden of educating the young and providing retirement pensions will be at its minimum (if current demographic trends prevail). This may be illustrated through the dependency ratio, that is, the ratio of the dependent age groups to the working age groups.<sup>(11)</sup> Presently, the overall dependency ratio is around 60, i.e., for every 100 persons of working age (18-64) in Canada there are 60 "dependents". The ratio is most likely to decline over the next 30 years because of the downward pull exerted by the lowered fertility. In fact, the youth dependency ratio drops by almost 40% over that period under the low fertility assumption. Somewhere around 2008, the overall dependency reaches its lowest level: 52. Then, as the baby-boom generations enter retirement ages, the overall ratio starts to increase, reaching a height of 77 at the end of the projection period, a level not far from the 1971 level (Table 18).

(11) Ages 0-17 and 65+ are here referred to as the dependent age groups and the 18-64, as the working age group.

sorte une période "prospère" sur le plan démographique alors que le fardeau financier que posent l'éducation des jeunes et les régimes de retraite serait à son minimum (dans l'hypothèse de prolongement des tendances actuelles). Les rapports de dépendance permettent d'illustrer ce phénomène<sup>(11)</sup>. Présentement, le taux de dépendance global est de l'ordre de 60, c.-à-d. que pour 100 personnes de 18-64 ans, on retrouve 60 "dépendants". Le rapport pourrait diminuer au cours des 30 prochaines années en raison de la pression à la baisse exercée par la faible fécondité. De fait, le rapport de dépendance des jeunes diminue de près de 40% au cours de cette période dans l'hypothèse de fécondité faible. Vers 2008, le rapport global atteint son niveau le plus bas: 52. Puis, avec l'arrivée à l'âge de la retraite des premières générations du baby-boom, celles nées dans l'après-guerre immédiat, on assistera à une augmentation du taux de dépendance, lequel pourrait atteindre 77 à l'horizon 2031, un niveau semblable à celui de 1971 (tableau 18).

(11) Les groupes d'âge dits dépendants sont ici les jeunes de 0-17 ans et les plus de 65 ans; la population dite active est celle des 18-64 ans.

TABLE 18. Dependency Ratios, According to the Low-growth Scenario, Canada, Selected Years 1971 to 2031

TABLEAU 18. Évolution des rapports de dépendance au Canada, selon le scénario de croissance faible, certaines années, 1971 à 2031

Year Année	Dependency ratio - Rapport de dépendance		
	Child (0-17)	Old (65+)	Total
	Enfants (0-17)	Personnes âgées (65+)	
1971	63.4	14.4	77.8
1981	45.2	15.6	60.8
1983	41.2 42.4	18.2 18.7	59.4 61.1
1991	37.4 38.0	21.6 18.7	58.7 56.7
2001	30.9 31.6	24.4 21.4	55.2 53.0
2011	25.3 25.9	27.4 24.2	52.7 50.1
2021	25.2 25.7	32.8 33.4	63.0 59.1
2031	25.0 24.5	51.6 45.3	76.6 70.8

Note: The dependency ratio expresses the number of people of "dependent ages" per 100 persons of "working age".

Nota: Le rapport de dépendance représente le nombre de personnes aux "âges dépendants" pour 100 personnes en âge de travailler.

## The Population 65 and Over

There is hardly any difference among the various scenarios in the number of people aged 65 and over. For the projection period up to 2031, the members of this age group have already been born; even those who will turn 65 in 2031 are already born. Hence, the variations in the population of this group are not governed by fertility, but solely by possible increases in length of life and future migration levels. The low-growth scenario will be used to examine its growth and structure.(12)

The 65-and-over population will grow at an extremely rapid pace during the projection period, especially after 2006. In 1983, the population of this group was 2.5 million. By 2015, it will have doubled to about 5.0 million. Growth is expected to continue at a high rate between 2015 and 2031, as the baby-boom cohorts reach retirement age. By 2031, the number of elderly will probably

(12) As noted earlier, the proportion of this group in the total population varies widely depending on the fertility assumption.

## Les plus de 65 ans

On ne parle même plus de scénarios différents ici puisque l'évolution de ce groupe d'âge peut être prévue à peu de chose près. C'est qu'en effet, pour la période de projection qui nous concerne ici, cet effectif est déjà né; même ceux qui atteindront 65 ans à l'horizon 2031 sont déjà nés. Les variations de cet effectif ne dépendent donc plus de la fécondité mais seulement de l'allongement possible de la durée de vie et du niveau futur de la migration. C'est donc à partir du scénario de croissance faible que nous allons illustrer sa croissance et sa structure(12).

L'effectif des personnes âgées de plus de 65 ans croîtra à un rythme extrêmement rapide au cours des prochaines années, plus particulièrement au-delà de 2006. En 1983, on estime à 2.5 millions l'effectif des 65 ans et plus. En 2015, il aura vraisemblablement doublé pour atteindre 5.0 millions. Entre 2015 et 2031, la croissance prévue est encore très rapide avec l'arrivée des générations du baby-boom à l'âge de la retraite.

(12) La proportion que ce groupe représente, on l'a vu dans une section précédente, varie pour sa part considérablement selon l'hypothèse de fécondité que l'on retient.

exceed 7 million, triple its present level (Table 19). This demographic potential of some 7 million people of retirement age (over 65), beyond any doubt, will be one of the major challenges of the 21st century.

Not only will the number of retired people increase, but also will this group grow older. By dividing the group into subgroups of 65-74 and 75 and over, we can readily see how aging is affecting this group. In 1983, the 65-74 accounted for 62% of the elderly population and the 75+, 38%. Early in the next century, around 2006, the former will account for only 53% and the latter 47%. The aging trend will be particularly pronounced among elderly women, as the proportion of women 75 and over will exceed that of 65-74, in 2006 (Table 19).

The numerical imbalance between the sexes in the elderly population, already visible in its present structure, is expected to continue in the future. Current projections assume a slight decrease in male excess in mortality. If this assumption proves correct, by 2006 there may be 76 males aged 65 and over for every 100 females. In 1983, the ratio was 74 per 100.

### Provincial Trends

There is a greater margin of uncertainty in the results at the provincial level than at the national level. The reason for this is the presence of an additional growth factor, interprovincial migration which is most unstable and unpredictable. For most of the provinces, the low-growth scenario in which recent trends are assumed to continue, is probably the most plausible in the short run, barring of course any drastic change in migration flows, which is quite possible.

As can be seen from Table 20, positive growth is expected for all the provinces over the 25-year projection period as a whole. However, for the five projections to the year 2006, there are several cases of population decline among the provinces: Manitoba, after 1997; Quebec, after 1995; and the Atlantic provinces, after 1996. In general, the growth rates of the provinces, though quite uneven, fall fairly steadily, in keeping with the trend projected for the Canadian population as a whole. Between 2001-2006, according to the low-growth scenario, most provinces may have a growth rate of between zero and 0.5%.

En 2031, l'effectif des personnes de plus de 65 ans dépassera vraisemblablement les 7 millions, soit trois fois le niveau actuel (tableau 19). Ce potentiel démographique de 7 millions de personnes représentera - à n'en pas douter - le défi majeur des années 2000.

Non seulement l'effectif de la population âgée augmentera-t-il rapidement mais encore on assistera à un vieillissement de cette sous-population. Si l'on divise l'effectif des plus de 65 ans en deux sous-groupes, soit les 65-74 ans et les plus de 75 ans, on peut facilement constater le phénomène du vieillissement de ce groupe. En 1983, les plus jeunes retraités, soit les 65-74 ans, représentaient 62% de l'ensemble des personnes âgées et les plus de 75 ans, 38%. Au début du siècle prochain, vers 2006, le segment plus jeune ne représentera plus que 53% et les plus âgés compteront pour 47% de l'ensemble du groupe. Chez les femmes âgées, le phénomène du vieillissement est particulièrement évident, alors qu'en 2006, la proportion des plus de 75 ans aura même dépassé celle des 65 à 74 ans (tableau 19).

Le déséquilibre numérique entre les sexes chez les personnes âgées, déjà présent dans la structure actuelle, est appelé à se maintenir dans l'avenir. Les présentes projections comportent en effet comme hypothèse de mortalité une légère réduction de la surmortalité masculine. Si cette hypothèse devait s'avérer exacte, l'on pourrait compter en 2006, 76 hommes pour 100 femmes âgées de plus de 65 ans. En 1983, la valeur de ce rapport est de 74 hommes pour 100 femmes.

### Les résultats au niveau provincial

Les résultats au niveau provincial comportent une marge d'incertitude beaucoup plus élevée que la projection au niveau national. C'est qu'on se trouve en présence d'un facteur de croissance additionnel - la migration interne - fort instable et difficile à prévoir. Le scénario de croissance faible, qui prolonge les tendances récentes, s'avère sans doute, pour la plupart des provinces, le scénario le plus plausible à court terme, à moins évidemment d'un changement radical - toujours possible - dans les flux migratoires.

Comme on peut le constater au tableau 20, les croissances prévues dans les provinces et territoires sont positives si l'on considère l'ensemble de la période des 25 prochaines années. Dans l'éventail de projections que nous avons retenu, on retrouve, avant l'horizon 2006, plusieurs cas de déclin démographique chez les provinces: le Manitoba à partir de 1997, le Québec à partir de 1995 et les provinces de l'Atlantique, au-delà de 1996. De façon générale, le rythme de croissance des provinces, quoique fort inégal, diminue plus ou moins régulièrement suivant en cela l'évolution prévue pour la population canadienne dans son ensemble. En 2001-2006, selon le scénario de croissance faible, la plupart des provinces présenteraient un taux de croissance variant entre zéro et 0.5%.

Provincial shares of the Canadian population change very slowly over time under all scenarios (Table 21). According to the projections, Ontario will continue to have the largest population, Quebec's percentage may decline slightly and that of Alberta and British Columbia would remain stable or increase depending on the scenario.

Le poids démographique des provinces est une donnée qui change très lentement. Ainsi, l'avenir tel qu'on peut le prévoir, consacre la prépondérance de l'Ontario, réduit la part du Québec et maintient ou augmente (selon les scénarios) celle de l'Alberta et de la Colombie-Britannique (tableau 21).

## Conclusion

The foregoing analysis of the projection results provides a wealth of information about the unprecedented direction of the emerging demographic trends in Canada over the next 50 years. There are two phenomena that will likely dominate the future development of the nation's demographic fortune in the years to come. First, the population will probably continue to grow slowly, then, by the turn of the century, it may eventually cease to grow and begin to decline if the current demographic trends prevail. Second, this slowdown in population growth would be accompanied by profound structural changes in the age distribution with an enormous increase in the number and proportion of the elderly.

Economic and social demands vary from one age group to another, and adjustments to age-specific requirements are difficult, especially when these alternate between being "too many" and "too few". All the three prime age groups, the young and old dependent groups and those making up the labour force, would experience phenomenal shifts in varying degrees during the projection period. The size and proportion of the young and elderly age groups could move in opposite directions, the former shrinking and the latter growing rapidly, while the labour force group would expand rapidly till the turn of the century.

The evolving new demographic trend - the drastic slowdown in population growth and the changing age structure - will have major

## Conclusion

Les résultats présentés dans ce rapport viennent jeter un éclairage nouveau sur l'orientation que la population canadienne est appelée à prendre au cours des prochaines décennies. Deux phénomènes domineront vraisemblablement l'avenir démographique de la nation. D'abord, un ralentissement de la croissance qui pourrait se poursuivre jusqu'à la fin du siècle, suivi à brève échéance d'un déclin, dans l'hypothèse d'un prolongement des tendances actuelles. Puis, un bouleversement profond de la structure par âge, notamment une augmentation rapide du nombre des personnes âgées et de leur proportion.

Les besoins d'ordre économique et social varient d'un groupe d'âge à l'autre et la satisfaction des exigences de chacun d'eux s'avère difficile, en particulier lorsque des périodes d'expansion et de contraction se succèdent régulièrement. Les trois principaux groupes d'âge, les jeunes, les plus de 65 ans et l'effectif constitué par la main-d'oeuvre, pourraient connaître une profonde mutation. La taille et la proportion des groupes formés par les jeunes et les plus âgés pourraient évoluer dans des directions opposées, le premier se rétrécissant et le second s'accroissant rapidement. Ce phénomène serait accompagné d'une expansion rapide de la population en âge d'activité d'ici la fin du siècle.

Cette nouvelle situation démographique, à savoir un ralentissement de la croissance accompagné de modifications dans la structure par

implications for a wide range of social and economic policy fields. Broadly speaking, the decline in the child population and the rise of the elderly may necessitate a massive shift of resources away from the needs of the young to the needs of the elderly.

## LIMITATIONS OF PROJECTIONS

As indicated in the Introduction, the accuracy of any projection is conditional on the reliability of the data on the base population and the components, and the degree to which the underlying assumptions successfully anticipate future trends. Population change is influenced by socio-economic and/or political factors, which cannot be clearly foreseen, and whose impact on demographic changes cannot be accurately measured. As Keyfitz observed (1971, p. 362), "if the future is wholly different from the past no amount of data and experience can assist prediction". In general, the uncertainty of the future population change can be expected to increase over the projection period and to be greater for smaller populations.

The assumptions on the components of growth, namely, fertility, mortality, international migration and internal migration are made on the basis of an analysis of past trends and the expected changes in the future based on current knowledge. The assumed future values are intended to provide a plausible range in the expected trends in the levels of each component during the projection period.

The development of component assumptions involved many related parameters for each component. These include assumptions on the mean and modal ages of fertility, the total fertility rate, the convergency between provincial and national fertility trends, national levels of immigration and emigration, the distribution of immigrants and emigrants by age and sex, the short- and long-term trends in interprovincial migration and the age-sex distribution of internal migrants. While multiple assumptions were made in the case of fertility, immigration and interprovincial migration, a single assumption was made for mortality and emigration. The desire to offer a range of assumptions on each component had to be balanced against the practical considerations of generating an excessive number of alternative scenarios. In general, single assumptions were made after determining that alternative assumptions would not have any substantial impact on the size and structure of the projected populations.

âge - ne manquera pas d'exercer une influence considérable sur un large éventail de politiques sociales et économiques. De façon générale, l'on peut dire que cette baisse de l'effectif des jeunes et la hausse de celui des âgés pourraient nécessiter un transfert massif de ressources de l'un à l'autre groupe.

## LIMITES DES PROJECTIONS

Comme il a été souligné dans l'introduction, la qualité d'une projection dépend de la fiabilité des données de la population de départ, des séries chronologiques et des hypothèses formulées. Plusieurs facteurs socio-économiques et politiques, qui sont imprévisibles et dont on ne peut pas mesurer précisément l'impact, peuvent influencer sur l'évolution démographique. Comme l'a fait observer Nathan Keyfitz (1971, p. 362), "si l'avenir se révèle totalement différent du passé, il est difficile de faire des prévisions, peu importe la quantité de données disponibles et l'expérience acquise". En général, le niveau d'incertitude s'accroît avec le temps et est beaucoup plus élevé dans le cas de populations de taille réduite.

Les hypothèses relatives à l'évolution des phénomènes démographiques, à savoir la fécondité, la mortalité, la migration internationale et la migration interne sont fondées sur une analyse des tendances passées et traduisent les variations que l'on peut prévoir dans l'état actuel des connaissances. Elles ont été conçues de façon à fournir un éventail plausible pour chacune des composantes.

Dans la préparation des projections, un grand nombre d'hypothèses ont dû être formulées. Les hypothèses ont porté notamment sur les âges moyen et modal à l'accouchement, l'indice synthétique de fécondité, le mouvement de convergence des indices de fécondité au niveau provincial et national, les effectifs nationaux d'immigrants et d'émigrants, leur répartition selon l'âge et le sexe, l'évolution à court et à long terme de la migration interprovinciale et sa structure par âge et sexe. Si l'on propose plus d'une hypothèse dans le cas de la fécondité, de l'immigration et de la migration interprovinciale, la mortalité et l'émigration ne font l'objet que d'une seule. Il a fallu tenter de concilier le désir de fournir un éventail d'hypothèses et les problèmes inhérents à la création d'un trop grand nombre de scénarios. En général, une hypothèse unique n'est retenue qu'après avoir vérifié que d'autres options n'auraient qu'un effet négligeable sur l'ensemble des résultats.

The long-range effects of projections may be determined by examining how sensitive they are to changes in the basic assumptions. A brief sensitivity analysis of projected population for Canada in a recent study (Basavarajappa and George, 1981, pp. 71-73) used various fertility and migration alternatives. The results showed that the projected population size was relatively insensitive to the choice of assumptions involving modest changes. However, the age distributions of the projected population were more sensitive to the choice of assumptions. The analysis also showed that compared with migration, small differences in the fertility level could have a larger influence on projected populations and that the impact would be greater for long-term projections.

### The Impact of Population Underenumeration on Projections

The base population for the current set of projections is the 1983 postcensal estimates for Canada and the provinces. These estimates, which are based on the 1981 Census population, are subject to the census underenumeration. A study of undercoverage in the 1981 Census has estimated that it was of the order of 2% for Canada (excluding the Territories), and varied from approximately 1% in Nova Scotia, Manitoba and Saskatchewan, to a little over 3% in British Columbia (for details see Statistics Canada, Catalogue No. 99-904). The study also shows that the undercoverage is not evenly distributed in each age but tends to be higher in certain age groups, e.g.: among young adults 15-44. The possible underestimation in the 1983 base population of the same magnitude as in the 1981 Census, is expected to be carried forward to future years. The age pattern of undercoverage in the projected population, however, will change since it is age cohorts and not age groups which retain the initial rate of undercoverage.

Some of the possible impact of undercoverage in the base population can be illustrated by comparing a projection using the 1983 base population adjusted for the 1981 Census undercoverage with that of a projection having the same component assumptions presented in this report. We have not made such a comparison here mainly because a similar evaluation was conducted using the 1976 Census-based population projections (see Statistics Canada, Catalogue No. 91-520, pp. 32-36). The results of the previous evaluation showed that the projected

On peut explorer les effets à long terme des projections en examinant dans quelle mesure elles peuvent être affectées par les modifications apportées aux hypothèses de départ. D'après une brève analyse, effectuée dans une étude récente (Basavarajappa et George, 1981, pp. 71-73) selon diverses hypothèses de fécondité et de migration, la taille de la population projetée du Canada ne varie pas de façon notable à la suite d'un changement mineur dans les hypothèses. Cependant, la répartition par âge y est plus sensible. Les résultats indiquent également qu'une faible variation de la fécondité peut avoir une plus forte influence sur les effectifs projetés qu'un changement dans le nombre de migrants; l'effet est encore plus sensible sur les projections à long terme.

### Effets du sous-dénombrement de la population sur les projections

La population de départ pour la projection actuelle est celle estimée au 1<sup>er</sup> juin 1983 pour le Canada et les provinces. Cette population, établie d'après le recensement de 1981, est affectée par le sous-dénombrement. Une étude portant sur la question a démontré que le sous-dénombrement de la population totale était de l'ordre de 2% pour le Canada (à l'exception des Territoires) et variait entre 1% en Nouvelle-Écosse, au Manitoba et en Saskatchewan et un peu plus de 3% en Colombie-Britannique (pour les détails, voir la publication n° 99-904 au catalogue de Statistique Canada). L'étude révèle également que ce phénomène n'est pas réparti de façon uniforme entre tous les groupes d'âge mais qu'il tend à être plus élevé dans certains groupes, par exemple chez les 15-44 ans. La sous-estimation possible de la population de départ de 1983, d'un ordre de grandeur équivalent à celle de 1981, devrait donc se retrouver dans les effectifs futurs. Toutefois, la structure du sous-dénombrement selon l'âge se modifie, car ce sont les générations et non les groupes d'âge qui conservent leur taux de sous-dénombrement.

Il est possible d'illustrer certains effets du sous-dénombrement de la population de départ en comparant les effectifs de deux projections, l'une corrigée du sous-dénombrement et l'autre, non corrigée. Le rapprochement n'a pas été fait ici, une comparaison analogue ayant été effectuée lors des projections antérieures (voir la publication n° 91-520 au catalogue de Statistique Canada, 1979, pp. 32-36). Selon les résultats de cette étude, la population totale projetée présente un niveau de sous-dénombrement similaire à celui de la population de départ. Pour certains groupes d'âge, toutefois, la différence entre les

total population reflected the persistence of the same amount of undercoverage in the base population. For specific age groups, however, the difference between the two projections fluctuated more widely. Similar results can be expected if a comparison is made between a projection using an adjusted base population for the 1981 Census undercoverage and that presented without adjustment for census underenumeration.

In the light of the above discussion, the possible effects of the 1981 Census underenumeration on the projections should be kept in mind in interpreting changes in projected population over time, especially if these changes are small.

#### AVAILABILITY OF UNPUBLISHED AND CUSTOMIZED PROJECTIONS

The application of the projection model to the possible combinations of assumptions on each component yielded 18 population projections for Canada, provinces and territories by single years of age and sex for each year from 1984 to 2006. The components of population growth were also produced for each year to 2006. These data are available according to user requirements from Statistics Canada, either on computer print-outs or on magnetic tape for the cost of data retrieval.

In addition, Statistics Canada's projection model is capable of producing customized population, household and family projections and simulations based on user-specified input assumptions. Requests for special projections for either one or more specified spatial units, population groups or components of growth will be considered on a cost-recovery basis.

Further enquiries regarding the users' services for special population projections, the projection methodology and unpublished projection data may be addressed to Population Projections Section, Demography Division, Statistics Canada, Ottawa, K1A 0T6 (telephone (613) 990-9585).

deux projections est plus prononcée. On peut s'attendre à des résultats semblables si une telle comparaison était réalisée ici.

Il est donc utile de se rappeler, dans l'interprétation de l'évolution démographique, de l'effet du sous-dénombrement, surtout si les accroissements sont faibles.

#### COMMENT OBTENIR LES PROJECTIONS NON PUBLIÉES

En appliquant le modèle de projection à toutes les combinaisons possibles d'hypothèses, on obtient 18 projections selon le sexe, pour chaque âge et chaque année, de 1984 à 2006, pour le Canada, les provinces et les territoires. Les composantes de la croissance démographique sont également produites pour chaque année. L'utilisateur peut, en assumant les frais d'extraction des données, obtenir de Statistique Canada une grande partie de ces données de projection sous la forme qui lui convient, c'est-à-dire imprimées d'ordinateur ou ruban magnétique.

On peut également obtenir des projections spéciales de population, de ménages et de familles d'après les hypothèses fournies par les utilisateurs, de même que des projections particulières pour des sous-régions ou encore des sous-groupes selon la formule de recouvrement des frais.

Les demandes de renseignements concernant les services offerts aux utilisateurs, les méthodes de projection et les données non publiées peuvent être adressées à la Section des projections démographiques, Division de la démographie, Statistique Canada, Ottawa, K1A 0T6 (téléphone (613) 990-9585).

QUINQUENNIAL PROJECTIONS OF THE TOTAL POPULATION FOR CANADA,  
PROVINCES AND TERRITORIES, 1986 TO 2006  
(THE 13 PROJECTIONS NOT SELECTED AND THE  
THREE PROJECTIONS COMBINING THE FERTILITY  
ASSUMPTIONS AND ZERO MIGRATION)

PROJECTION QUINQUENNALE DE LA POPULATION TOTALE DU CANADA,  
DES PROVINCES ET TERRITOIRES, 1986 À 2006  
(SELON LES 13 PROJECTIONS NON RETENUES ET  
LES TROIS PROJECTIONS AVEC MIGRATION NULLE)

PROJECTIONS OF THE TOTAL POPULATION FOR CANADA, PROVINCES AND TERRITORIES, 1986 - 2006  
PROJECTION DE LA POPULATION TOTALE DU CANADA, PROVINCES ET TERRITOIRES, 1986 - 2006  
IN THOUSANDS - EN MILLIERS
